A detailed breakdown of the costs listed in Table 8 can be found in the Updated BART Analysis. The Department has reviewed these costs and believes them to be accurate.

NPS: We adjusted the CCS four-factor analysis cost analyses for SNCR and SCR as follows:

- We used the CCM Method 1 to estimate catalyst cost because it is “transparent” and relies upon defined values for catalyst volume, cost, life, and interest rate. CCS four-factor analyses used the CCM Method 2 which does not reveal the inputs.
- We estimated costs in 2019\$ and used a lower CEPCI value. The CCS four-factor analyses used 2018\$ and an unjustified high CEPCI.
- We used the current prime interest rate (3.25%) as recommended by the CCM instead of 5.25%.

NDDEQ: As displayed in Table 8, the cost of compliance for the installation of LNC3+ at CCS is \$700 per ton of NO_x reduced. This represents a 0.05 lb NO_x per MMBtu improvement over the baseline performance rate and results in an annual reduction of over 1,100 tons of NO_x per unit.

If SNCR is installed along with LNC3+, a performance rate improvement of 0.03 lb NO_x per MMBtu could be achieved. This equates to an additional reduction of approximately 700 tons of NO_x per year for each unit. To provide the most conservative cost of compliance (i.e., the lowest dollar per ton of pollutant reduction) for SNCR, Table 8 does not include additional costs associated with the treating of ammoniated fly-ash or the additional cost incurred due to the loss of a saleable by-product, which would result in an increase in fly-ash disposal. There is also uncertainty in the amount of saleable by-product that would be lost and the limited commercial application of the treating process; both of which are required to better understand the impacts a treating system would have at CCS. Without this information, the ultimate cost of SNCR is unknown. Without taking these costs into consideration, the cost of compliance to concurrently install LNC3+ with SNCR is \$3,300 per ton of NO_x reduced.

To determine the appropriate BART controls when comparing between the installation of only LNC3+ and the installation of LNC3+ with SNCR, the Department calculated the stand-alone

cost of installing SNCR after LNC3+ is installed. This stand-alone cost is referred to as the incremental cost of compliance or the incremental cost effectiveness in the BART guidelines. Incremental cost is a key factor to consider when selecting BART controls since it details the cost effectiveness specific to the SNCR. The incremental cost of compliance was determined to be \$7,800 per ton of NO_x reduced. Therefore, even though the cost of compliance for LNC3+ with SNCR listed in Table 8 appears reasonable at \$3,300 per ton, it is more accurate to represent the cost of LNC3+ at \$700 per ton and the cost of SNCR after the installation of LNC3+ at \$7,800 per ton. The Department believes \$7,800 is an unreasonably high cost, especially in consideration of the potential increased costs through the installation of a fly-ash treating system, lost fly-ash sales, and the technological uncertainty with the treating system viability at CCS. Between LNC3+ and LNC3+ with SNCR, LNC3+ is the most appropriate BART control from the perspective of cost feasibility.

All costs associated with the SCRs are provided for the high-dust arrangement. High-dust systems are generally considered more economical than low-dust systems since less equipment is required during operation. Exhaust gas re-heat and cooling systems are among the additional costs required with low-dust SCR systems. The cost of compliance will increase significantly with the additional equipment needed for a low-dust SCR system. Without taking these added costs into consideration, the cost to install LNC3+ concurrently with SCR is (at a minimum) \$6,300 per ton of NO_x reduced. Using the same logic applied in the SNCR discussion in the above paragraph, the incremental cost to install SCR after LNC3+ is \$10,300 per ton. Additionally, for consistency with the BART guidelines, the Department calculated the incremental cost between SNCR and SCR. This resulted in an incremental cost of \$12,200 per ton. The Department believes all these costs are unreasonably high, especially in consideration of the technological uncertainty with SCR and the added costs associated with the exhaust reheat and cooling systems.

NPS: the results of our application of the CCM workbooks are shown in Table 21 below.

Table 21. NPS Revised Table 8: CCS Unit 1 Cost of Compliance and Incremental Cost of Compliance

Control Technology	Performance Level (lb/MMBtu)	Annual Emission Reduction (tpy)¹	Annualized Total Cost (\$)²	Cost of Compliance (\$/ton)²	Incremental Cost of Compliance (\$/ton)³
Baseline, LNC3	0.18	--	--	--	--
LNC3+	0.15	1,032	793,418	768	--
LNC3+ w/ SNCR	0.12	631	3,141,707	4,982	
LNC3+ w/ SCR	0.04	2,344	12,988,582	5,542	5,748

¹ relative to LNC3+

² in addition to LNC3+

³ relative to LNC3+ w/ SNCR

We agree with NDDEQ that optimizing the combustion controls is the appropriate first step in reducing emissions, so we based our estimates on adding post-combustion controls to the existing LNC3+ controls. Because CAMD data has shown that LNC3+ on Unit 1 is achieving 0.15 lb/mmBtu (instead of the 0.13 lb/mmBtu assumed by NDDEQ), we adjusted its “Annual Emission Reduction” accordingly.

Addition of SNCR could reduce NO_x by an additional 631 tons/year at an additional cost of \$3.1 million /yr. The cost-effectiveness of this strategy is less than \$5,000/ton and is well below the NDDEQ round one threshold adjusted for inflation (\$7,300/ton incremental cost-effectiveness).

Addition of SCR could reduce NO_x by an additional 2,344 tons/year (versus LNC3+) at an additional cost of \$13million/yr. The cost-effectiveness of this strategy is less than \$6,000/ton and is well below the NDDEQ round one threshold adjusted for inflation. Likewise, the incremental cost-effectiveness relative to the SNCR strategy is below \$6,000/ton, also well below the NDDEQ round one threshold adjusted for inflation.

Table 22. NPS Revised NDDEQ Table 8: CCS Unit 2 Cost of Compliance and Incremental Cost of Compliance

Control Technology	Performance Level (lb/MMBtu)	Annual Emission Reduction (tpy) ¹	Annualized Total Cost (\$) ²	Cost of Compliance (\$/ton) ²	Incremental Cost of Compliance (\$/ton) ³
Baseline, LNC3	0.18	--	--	--	--
LNC3+	0.13	1,162	793,418	683	--
LNC3+ w/ SNCR	0.13	535	2,981,040	5,573	
LNC3+ w/ SCR	0.04	1,927	12,867,354	6,679	7,104

¹ relative to LNC3+

² in addition to LNC3+

³ relative to LNC3+ w/ SNCR

CAMD data has shown that LNC3+ on Unit 2 is achieving the 0.13 lb/mmBtu assumed by NDDEQ. Addition of SNCR could reduce NO_x by an additional 535 tons/year at an additional cost of \$3 million /yr; the cost-effectiveness of this strategy is less than \$5,600/ton and is well below the NDDEQ round one threshold adjusted for inflation.

Addition of SCR could reduce NO_x by an additional 1,927 tons/year (versus LNC3+) at an additional cost of \$13 million/yr; the cost-effectiveness of this strategy is less than \$6,700/ton and is well below the NDDEQ round one threshold adjusted for inflation established by NDDEQ. Likewise, the incremental cost-effectiveness relative to the SNCR strategy is below \$7,100/ton, also below the NDDEQ round one threshold adjusted for inflation.

Energy and Non-Air Quality Environmental Impacts (Statutory Factor 3)

NDDEQ: LNC3+ is determined to have negligible energy and/or non-air quality environmental impacts. LNC3+ technology reduces the formation of NO_x during the combustion process and

does not affect items such as: auxiliary power consumption, water usage, potential fly ash sales, and/or ammonia slip, which are all potential impacts associated with SNCR and/or SCR.

The largest potential non-air quality environmental impact with SNCR is the potential for producing ammoniated fly-ash, which could inhibit or severely limit CCS from selling fly-ash for beneficial use (e.g., concrete additive). This ammoniated fly-ash has the largest impact on non-air quality environmental impacts since ammoniated fly-ash not being sold for beneficial use could end up significantly increasing the amount of fly-ash disposed of in landfills. The production of ammoniated fly-ash also reduces any economic benefit CCS receives from selling this by-product. SNCR also requires a significant increase in water consumption for the injection skid. Additionally, ammonia slip from the SNCR will likely result in nitrogen being carried through the scrubber water that is routed to the evaporation ponds, causing potential issues with pond maintenance.

Low-dust SCR has the same potential non-air quality environmental impacts as SNCR regarding increased water consumption and ammonia slip.

NPS: The impacts of SCR on water consumption and ammonia slip are far less than for SNCR.

NDDEQ: There is also increased power and fuel consumption required with SCR related equipment and from the gas reheat and cooling systems.

NPS: These factors are accounted for in the economic analysis, statutory factor 1.

NDDEQ: The non-air quality environmental impacts for SNCR and SCR are significant, but not significant enough to eliminate them as a control option.

Remaining Useful Life (Statutory Factor 4)

NDDEQ: Coal Creek Station is expected to operate beyond the life of the control equipment, therefore, remaining useful life was not considered.

3.3.6 Conclusions & Recommendations

- Other states have set cost-effectiveness thresholds of: \$5,000/ton for EGUs in AR and TX, \$7,000/ton in NM, and \$10,000/ton in CO and OR.
- The cost effectiveness of minimizing flue gas bypass at CCS would be acceptable in the context of the previous ND BART thresholds as well as the thresholds used by the states cited and could cost-effectively reduce facility SO₂ emissions by almost 1,400 tons/yr.
- The incremental cost effectiveness of adding SNCR at CCS would be acceptable in the context of the previous threshold used by ND. Addition of SNCR could reduce facility NO_x emissions by almost 1,200 tons/yr.
- The incremental cost effectiveness of adding SCR at CCS would be acceptable in the context of the previous threshold used by ND. Addition of SCR could reduce facility NO_x emissions by over 4,200 tons/yr.

3.4 Milton R Young

3.4.1 Summary of NPS Recommendations and Requests for Milton R. Young Station

The NPS review of the four-factor analysis conducted for Milton R. Young Station (MRYS) finds that there are technically feasible and cost-effective opportunities available to further control SO₂ and NO_x emissions from Units 1 and 2. In fact, we find that the cost of control is more economical than the SIP estimate when analyses are adjusted in accordance with the EPA Cost Control Manual.

Although ND has not established a cost threshold for this round of regional haze planning, we can advise that other states have set cost-effectiveness thresholds of: \$5,000/ton for EGUs in AR and TX, \$7,000/ton in NM, and \$10,000/ton in CO and OR.

The cost effectiveness of modifying the existing SO₂ scrubbers at MRYS would be acceptable in the context of the previous ND BART thresholds as well as the thresholds used by states in this round of regional haze planning. This strategy could reduce SO₂ emissions by over 1,600 tons/year compared to existing controls.

We find two opportunities for reducing NO_x emissions at MYRS. 1) The annual average and incremental cost-effectiveness of adding Rich Reagent Injection (RRI) to reduce NO_x emissions at MRYS Unit 2 would be acceptable in the context of the thresholds used by CO, NM, and OR. This strategy could reduce NO_x emissions by over 3,500 tons/year compared to existing controls. 2) The annual average cost effectiveness of adding SCR at MRYS Units 1 and 2 would be acceptable in the context of the previous ND BART thresholds as well as the thresholds used by other states in this round of regional haze planning. This strategy could reduce NO_x emissions by over 10,700 tons/year compared to existing controls.

We recommend that ND take every opportunity to reduce SO₂ and NO_x emissions from the Milton R. Young Station in this planning period. By requiring implementation of identified controls ND will be reducing haze causing emissions and advancing incremental improvement of visibility at Theodore Roosevelt, Badlands, and Wind Cave National Parks as well as other Class I areas in the region.

3.4.2 Milton R. Young Plant Characteristics

Milton R. Young Station (MRYS) is a 734 MW lignite coal-fired power station near Center, North Dakota. Theodore Roosevelt National Park, a Class I area administered by the National Park Service (NPS), is 161 km west of this facility.

Of 1,167 facilities in EPA's Clean Air Markets Database (CAMD) in 2020, MRYS ranked #74 for sulfur dioxide (SO₂) emissions (2,677 tons) and #9 for nitrogen oxides (NO_x at 8,562 tons). MRYS' carbon dioxide emissions of 5,579,430 tons rank #63 in the US. MRYS also ranked #5 for EGU mercury (Hg) emissions with 198 lb in 2017.

MRYS has two subcritical Babcock & Wilcox cyclone boiler generating units firing North Dakota lignite supplied from BNI Coal, Ltd's adjacent Center Mine. Unit 1 (257 MW) is owned by Minnkota Power Cooperative and commenced commercial operation in 1970. The boiler is

fired by seven ten-foot diameter cyclone furnaces, arranged "three over four" across the front wall of the lower boiler.

Unit 2 (477 MW) is owned by Square Butte Electric Cooperative and commenced operation in 1977. The boiler is fired by twelve ten-foot diameter cyclone furnaces, arranged "three over three" across the front and rear walls of the lower boiler.

Both units have tubular air heaters installed between the boiler and the flue gas ductwork leading to an ESP. The boilers at MRYS include a unique coal conditioning system (drying, crushing, and feeding) for each cyclone furnace specifically designed to aid in proper combustion of the lignite fuel.

On April 24, 2006 the Department of Justice and the EPA announced a settlement of a case alleging violations of the New Source Review (NSR) provisions of the Clean Air Act requiring Minnkota Power Cooperative and Square Butte Ele. On April 24, 2006 the Department of Justice and the EPA announced a settlement of a case alleging violations of the New Source Review (NSR) provisions of the Clean Air Act requiring Minnkota Power Cooperative and Square Butte Electric Cooperative (both member-owned rural utilities) to reduce 23,561 tons/year of SO₂ by 2012, 9,458 tons/year of NO_x by 2010, and to comply with declining plant-wide caps for SO₂. (The proposed Consent Decree requirements were incorporated into enforceable permits.) The agreement resolved Clean Air Act violations that occurred at MRYS. As a result, both units are now equipped with selective non-catalytic reduction (SNCR) for NO_x control. Each unit is equipped with wet flue gas desulfurization (FGD) for SO₂ control and an electrostatic precipitator (ESP) for particulate control. Each unit employs halide injection and activated carbon injection for the control of mercury.¹⁷ Table 23 below shows a breakdown of 2020 SO₂ and NO_x emissions and how they rank versus the 3,317 EGUs in CAMD.

Table 23. MRYS 2020 SO₂ and NO_x emissions and how they rank versus the 3,317 EGUs in CAMD

Unit ID	SO ₂ (tons)	SO ₂ (tons) Rank	Avg. SO ₂ Rate (lb/MMBtu)	Avg. SO ₂ Rate (lb/MMBtu) Rank	NO _x (tons)	NO _x (tons) Rank	Avg. NO _x Rate (lb/MMBtu)	Avg. NO _x Rate (lb/MMBtu) Rank
B1	504	296	0.053	433	3,166	32	0.334	80
B2	2,173	101	0.134	236	5,396	6	0.334	81

3.4.3 First Planning Period Regional Haze Control Requirements for MRYS 1 and 2

Best Available Retrofit Technology (BART) controls selected in the first round of the Regional Haze program were Advanced Separated Over Fire Air (ASOFA) for NO_x control. (The SNCR was added as a result of the federal enforcement action.) In United States v. Minnkota Power

¹⁷ January 2021 Hg emissions were: Unit 1= 3.22 lb/Trillion Btu (TBtu), Unit 2 = 3.61 lb/TBtu.

Cooperative, Inc. the court concluded that the State’s best available control technology (BACT) analysis for NO_x control on Minnkota Power’s Milton R. Young Station (MRYS) Units 1 and 2 was not unreasonable, a conclusion that was contrary to EPA’s position at the time of the Proposed FIP. Subsequently, EPA noted that the technical feasibility determination under the BACT and BART analyses was substantially the same. The BART Guidelines permit a state to rely upon a BACT determination for purposes of selecting BART unless new technologies have become available or best control levels for recent retrofits have become more stringent. The charts below show SO₂ and NO_x emissions for the MRYS units.

Figure 13. MRYS Unit 1, Calculated Avg. SO₂ Rate (1980–2020)

Figure 14. MRYS Unit 1, Calculated Avg. NO_x Rate (1995–2020)

Figure 15. MRYS Unit 2, Calculated Avg. SO₂ Rate (1980–2020)

Figure 16. MRYS Unit 2, Calculated Avg. NO_x Rate (1995–2020)

3.4.4 Second Planning Period Reasonable Progress Control Requirements for AVS Units 1 and 2

NDDEQ: MRYS Unit 1 has a Q/d of 24 and MRYS Unit 2 has a Q/d of 43. Therefore, the Department sent a letter to Minnkota Power Cooperative, Inc. (Minnkota) on May 2, 2018 requesting a four-factor analysis for MRYS. The letter required that Minnkota’s four-factor analysis be submitted to the Department on or before January 31, 2019. Minnkota’s original four-factor analysis was submitted to the Department on January 31, 2019. The Department provided comments to Minnkota regarding their four-factor analysis on March 18, 2019.

Burns & McDonnell Engineering Co. (B&M) submitted a response to the Department’s comments on behalf of Minnkota, along with a revised four-factor analysis, on May 29, 2019. The analysis included an assessment of potentially available SO₂ and NO_x emission reduction

technologies that could be applied to MRYS Units 1 and 2. Following are excerpts from the May 2019 B&M report—we note where we have differences.

SO₂ Emissions Controls

B&M for MRYS: The scrubber inlet SO₂ conditions for each unit at MRYS are measured using continuous emissions monitors (CEMS). These inlet conditions during the baseline period for Unit 1 (2.327 lb/MMBtu) and Unit 2 (2.487 lb/MMBtu) will be used as the basis for future sulfur content at the inlet of each scrubber.¹⁸

WET FLUE GAS DESULFURIZATION

B&M for MRYS: For the purposes of this analysis, new wet FGD performance was evaluated at 98% SO₂ removal. Due to the relative ages of Unit 1 and Unit 2 scrubbers, a new wet scrubber was considered only for Unit 2, as the Unit 1 wet scrubber was placed in service relatively recently, in 2011. Based on the ability of a new wet FGD system to achieve 98% percent SO₂ removal efficiency and considering the commercial availability and applicability, a new wet FGD system was found to be a technically feasible regional haze control technology¹⁹ alternative for MRYS Unit 2 SO₂ emission control.

MODIFICATION OF EXISTING WET FGDs.

B&M for MRYS: This report also evaluates the modification of the existing wet FGD process currently operating on Unit 1 and Unit 2 as a possible regional haze control technology alternative. The original equipment manufacturer (OEM) of the Unit 1 scrubber was engaged to evaluate modifications required to increase the removal efficiency of the existing wet FGD processes. The same OEM has previously studied upgrading the Unit 2 scrubber to achieve higher removal efficiency, and was engaged to update and confirm the results of that study. Upgrades evaluated include increasing the liquid-to-gas ratio, installation of new types of spray nozzles, running additional pumps, and adjusting the operating conditions of the scrubber. The OEM study evaluated the scrubbers based on the highest sulfur coal (3.16 lb SO₂/MMBtu) identified by core samples collected and analyzed by the mine that supplies MRYS. The high sulfur fuel is utilized in this evaluation to ensure the updated scrubber is capable of the necessary long-term fuel flexibility associated with a mine mouth plant. The removal rates referenced in the confidential vendor proposal (submitted separately under confidentiality) are coal to chimney short term (test period) removal rates reflective of vendor determined performance. This regional haze control technology evaluation has applied selected removal rates across the scrubber.

The selected rates applied across the scrubber is considered a reasonable balance of the difference between: the baseline scrubber inlet SO₂ and the studied sulfur content of the coal, consideration of the need for margin between a guarantee and long term continuously achievable performance, and long term (annual performance) basis of this evaluation. Optimizing Unit 1 is

¹⁸ The baseline emission rates were developed by evaluating the three most recent years (2016-2018) for Unit 1 and for Unit 2. This baseline was established in consultation with the NDDEQ. The baseline period, for each unit, contains two non-major outage years and one major outage year.

¹⁹ Regional Haze Control Technology

assumed to increase removal across the scrubber to 97.4% by increasing stoichiometry (Ca/S) to 1.025.²⁰ Upgrading Unit 2 is assumed to increase removal across the scrubber to 97.6% utilizing the recommended nozzle changes, additional spray header, and increasing the stoichiometry to 1.020.²¹ MRYS did not increase the stoichiometry in Unit 2 to the same level as Unit 1 because MRYS experience on Unit 2 is that operating at higher pH (associated with higher stoichiometry) will cause increased scaling and plugging of the suction screens to the spray recycle pumps that will reduce the liquid to gas ratios, and hence lower SO₂ removal.

NPS: The chart below shows increasing SO₂ emission rates at Unit 2.

Figure 17. MRYS Unit 2, Increasing SO₂ emission rate (2011–2020)

SEMI-DRY FLUE GAS DESULFURIZATION

B&M for MRYS: No SDA process has clearly demonstrated the ability to achieve SO₂ removal levels similar to wet FGD systems in the U.S. The application of high SO₂ removal SDA system for high sulfur coal have been limited in the industry due to multiple factors. For purposes of completeness an SDA system is assumed to be able to achieve 93% removal in this application.

The CDS system can increase the lime injection rate independent of the water injection and higher removal rates can be achieved. The CDS system removal is assumed to be equivalent to the retrofit wet FGD system achieving 95-97% removal.

REACT DRY SCRUBBING PROCESS

B&M for MRYS: ReACT (Regenerative Activated Coke Technology) is a multipollutant control system that utilizes activated coke to remove SO₂, NO_x and mercury. The process is divided into three main processes: 1) adsorption, 2) regeneration, and 3) recovery. In the first

²⁰ NPS: We estimate that the Unit 1 FGD is currently achieving 97.1% efficiency.

²¹ NPS: We estimate that the Unit 2 FGD is currently achieving 94.8% efficiency.

step, ammonia is injected into the flue gas and the flue gas is passed through an adsorber filled with a moving bed of activated coke pellets where the SO₂ and mercury are adsorbed and the NO_x is reduced to N₂. In the second step, the activated coke pellets are transferred to a second vessel to be regenerated for recycle/reuse through thermal desorption. The captured mercury is concentrated in the lower portion of the regenerator vessel. The resulting gas from the regeneration step is a concentrated stream of SO₂ that must be further treated in a separate acid recovery plant to produce a sellable sulfuric acid byproduct. Sulfuric acid is a worldwide commodity that, with access, can be sold year-round. This ReACT process is installed and operating on multiple low sulfur coal fired units achieving 2'99% SO₂ removal. Burns & McDonnell contacted the supplier of the ReACT process and discussed the application of the technology to an application like MRYS. It was determined that MRYS is 'not a good application' for the technology, however, the technology could be applied and would work. Factors in this application at MRYS that would impact performance and cost of ReACT include that the inlet temperature is too high, higher oxidation of the activated coke can be expected, and the sulfuric acid production rates would be very high. This technology is still considered a viable alternative and previous ReACT pilot tests on high sulfur coals have shown ReACT can achieve 92-98% SO₂ removal rates.

– Cost of Compliance (Statutory Factor 1)

B&M for MRYS: The following sections evaluate the top two ranked control options for Unit 2, replacing the existing wet FGD system with a new wet FGD system, and upgrading the Unit 2 scrubber. A new wet FGD was not considered for Unit 1, as the existing wet FGD began operations in 2011 as part of the previous BART/BACT analysis and is within the previously evaluated useful life. The top ranked control option for Unit 1, modify the existing wet FGD, is evaluated.

NEW WET FGD CAPITAL COST ESTIMATE

B&M for MRYS: Cost estimates for the new wet FGD SO₂ control technologies were completed utilizing the 'IPM Model - Updates to Cost and Performance for APC Technologies Wet FGD Cost Development Methodology' available from the U.S. Environmental Protection Agency and supplemented with engineering estimates based upon Burns & McDonnell's in-house experience. The IPM Model Update is a formula-based report that was specifically developed to estimate the cost of wet FGD technologies for utility power plants. The report was prepared for the EPA in January 2017. The report is available for download from the U.S. EPA website⁷.

NPS: Subsequent to the B&M analysis, EPA revised the Control Cost Manual (CCM) to estimate costs of acid gas controls—the EGU estimates are based upon the IPM models referenced by B&M and developed by Sargent & Lundy. Our application of the CCM to replacement of the wet scrubbers resulted in cost-effectiveness values that are prohibitive.

WET FGD MODIFICATION CAPITAL COST ESTIMATE

B&M for MRYS: Cost estimates for retrofitting the existing wet FGD systems were based on the equipment modification and associated pricing provided by the OEM (provided separately

under confidentiality) and supplemented with engineering estimates for installation based upon Burns & McDonnell's in-house experience.

This evaluation assumes all of the existing BOP systems are capable of supporting the new system with no further upgrades. Further, it is assumed there is no change in operating staff and only a proportional change in the variable operating cost. These conservative assumptions minimize the overall project cost resulting in a conservatively low dollars per ton control cost.

The capital cost estimate for the Unit 1 wet FGD system modification includes the OEM recommendation to replace three out of the four recirculation pump motors to increase the liquid to gas ratio in the scrubber. During this investigation, the existing electrical system and foundation associated with the pump was reviewed and is believed to be sufficient to support this upgrade with no further modifications.

The capital cost estimate for the Unit 2 wet FGD system modification includes the OEM recommendation to replace all of the absorber spray nozzles with dual flow nozzles. The OEM did not recommend upgrading the pumps on Unit 2 due to velocity limitations in the riser pipe and headers and did not recommend upgrading the riser headers and spray headers to accommodate more flow as these upgrades could compromise or complicate the conditions of the existing towers.

NPS: We reviewed B&M's cost estimates and note that the Capital Recovery Cost was based upon a 5.5% interest rate and 20-year life which resulted in a Capital Recovery Factor = 0.08368. The CCM recommends use of the current prime interest rate (3.25%) over 30 years which yields a CRF = 0.0527. Our revised costs are shown in Tables 24 and 25 below.

Table 24. NPS Revised B&M Table 3-8: MRYS Unit 1 SO₂ Control System Annualized Total Cost

SO ₂ Control Alternative	Percent Removal	Emission Rate lb/10 ⁶ Btu	Annual Emission (tpy) ¹	Annual Emission Reduction (tpy) ¹	Installed Capital Cost (\$) ²	Capital Recovery Cost (\$) ²	Annual O&M Cost (\$)	Annualized Total Cost (\$) ³	Actual Unit Control Cost (\$/ton) ⁴
Modified Wet FGD	97.40%	0.061	632	145	800,000	42,160	300,000	342,160	2,360
Baseline	96.80%	0.075	777	Baseline					

¹ Based on baseline heat input of 20,726,417 MMBtu/yr

² All Costs in 2019 dollars.

³ For ATC calculation, Capital Recovery Factor = 0.0527 and first year O&M Cost.

⁴ Overall control cost is ATC divided by actual annual emissions reduction of each alternative.

Table 25. NPS Revised B&M Table 3-9: MRYS Unit 2 SO₂ Control System Annualized Total Cost

SO ₂ Control Alternative	Percent Removal	Emission Rate lb/10 ⁶ Btu	Annual Emission (tpy) ¹	Annual Emission Reduction (tpy) ¹	Installed Capital Cost (\$) ²	Capital Recovery Cost (\$) ²	Annual O&M Cost (\$)	Annualized Total Cost (\$) ³	Actual Unit Control Cost (\$/ton) ⁴
Modified Wet FGD	97.70%	0.057	979	1,185	1,700,000	9,590	700,000	789,590	666
Baseline	94.90%	0.126	2,164	Baseline					

¹ Based on baseline heat input of 34,354,956 MMBtu/yr

² All Costs in 2019 dollars.

³ For ATC calculation, Capital Recovery Factor = 0.0527 and first year O&M Cost.

⁴ Overall control cost is ATC divided by actual annual emissions reduction of each alternative.

NPS: The cost-effectiveness of modifying the existing scrubbers is well within accepted values.

– Time Necessary for Compliance (Statutory Factor 2)

NDDEQ: The process to bid, design, purchase, and install retrofits to an existing WFGD system can take two to three years. The time necessary for compliance is not a limiting factor when determining additional reasonable controls for MRYS Unit 1 SO₂ emissions since the WFDG could be modified prior to the end of the second planning period.

– Energy and Non-Air Quality Environmental Impacts (Statutory Factor 3)

ENERGY

NPS: Energy impacts are addressed under statutory factor 1, cost of compliance.

NON-AIR QUALITY ENVIRONMENTAL IMPACTS

B&M for MRYS: Non-air quality environmental impacts of replacing the existing wet FGD with a new wet FGD or retrofitting the existing FGD systems are expected to be very similar to the impacts of the existing system. These may include hazardous waste generation, solid and aqueous waste streams. The primary change anticipated due to the use of a new wet FGD or modifying the existing FGD systems will be an incremental increase in the solids disposal rate as additional removal of SO₂ will result in increased byproduct.

NPS: The impacts raised are standard to the operation of this control technology.

– Remaining Useful Life (Statutory Factor 4)

NDDEQ: Based on the information provided to the Department, MRYS is expected to operate beyond the life of the control equipment. Therefore, remaining useful life was not considered.

NO_x Emission Controls

SELECTIVE CATALYTIC REDUCTION

B&M: There are variations in the SCR process for coal-fired boilers that mostly involve locations in the flue gas path where the catalyst is placed in order to promote the desired NO_x emission reduction effect. This technology was reviewed in the previous BART and BACT

analysis (2008-2010) and it was concluded by NDDEQ that SCR systems (of all types) are technically infeasible at MRYS. No new information or experience has occurred since 2010 to change the conclusion of this analysis and this technology remains technically infeasible.

NPS: NDDEQ has recently determined that Tail-End SCR (TE-SCR) is technically feasible on ND lignite-fired boilers that are tangentially- or wall-fired, but infeasible for cyclone boilers like those at MRYS. We are not aware of any test data on the tail-end emissions at MRYS that support NDDEQ's determination. We recommend that TE-SCR should be fully evaluated at MRYS.

RICH REAGENT INJECTION & SELECTIVE NON-CATALYTIC REDUCTION

B&M for MRYS: Rich Reagent Injection (RRI) has been demonstrated and placed in continuous operation on multiple cyclone boilers. RRI is specifically intended for NO_x emissions control on cyclone boilers. RRI adds dilute urea reagent to the hot boiler gases near the cyclones, which must be devoid of free oxygen in order to avoid oxidation of the urea and formation of additional NO_x. This system is combined with SNCR to further reduce NO_x emissions within the boiler. The ASOFA system would be operated in conjunction with the RRI and SNCR systems. RRI is considered technically feasible under limited conditions for application on the Unit 1 and Unit 2 cyclone boilers at MRYS.

OPTIMIZED SELECTIVE NON-CATALYTIC REDUCTION

B&M for MRYS: Taking into consideration the past operating experience of the existing system and vendor experience since the original installation, there is potential to reduce the emission rate further with enhancements to the existing system. These enhancements could include changing the nozzles on existing lances, replacing the existing lances, and adding lances in new locations. Additionally, allowing for higher ammonia slip rates than originally designed (i.e., 10 ppm vs. 5 ppm) will allow for higher levels of urea injection, which has the potential to further reduce NO_x emission rates. The ASOFA system would be operated in conjunction with the optimized SNCR system. Optimized SNCR is considered technically feasible for application on the Unit 1 and Unit 2 cyclone boilers at MRYS.

– Cost of Compliance (Statutory Factor 1)

B&M for MRYS: Cost estimates for the RRI + SNCR control technology were developed based on proposals from an RRI + SNCR vendor, and installation estimates were based upon Burns & McDonnell's in-house experience for additional water treatment, compressed air, balance of plant (BOP) piping, access, and installation. The RRI + SNCR vendor utilized computerized fluid dynamics (CFD) modeling results completed by another vendor as well as conducted on-site data measurement of boiler temperature and species of NO_x, CO and O₂. The measured data was mapped and used to perform additional CFD modeling to determine the equipment and optimum injection locations. The data collected by these vendors and the proposal of the RRI + SNCR technology vendor provide good assurance that the application of these technologies, and their associated costs, are well understood for the boilers at MRYS.

NPS: We reviewed B&M's cost estimates and note that the Capital Recovery Cost was based upon a 5.5% interest rate and 20-year life which resulted in a Capital Recovery Factor = 0.08368. The CCM recommends use of the current prime interest rate (3.25%) over 20 years for SNCR which yields a CRF = 0.0688; for SCR the CCM recommends a 30-year life which yields a CRF = 0.0527.

We applied the current CCM SNCR workbook to estimate the costs of the existing systems and subtracted those O&M costs from the costs of new SCR systems which were estimated by application of the corresponding CCM workbook. Our results are shown in the Tables 26 and 27 below.

Table 26. NPS Revision 1 to B&M Table 2-8: Annualized Total Cost of MRYS Unit 1 NO_x Control Technologies (2019\$)

NO _x Control Alternative	Emission Rate (lb/mmBtu)	Annual Emission Reduction (tpy)	Installed Capital Cost	Capital Recovery Cost (\$)	Annual O&M Cost (\$)	Annualized Total Cost (\$)	Actual Unit Control Cost (\$/ton)	Incremental Unit Control Cost (\$/ton)
SCR	0.05	3,961	103,534,350	5,456,260	-2,107,972	3,356,906	1,857	-730
Applied RRI+SNCR/ASOFA	0.28	539	8,164,160	561,694	5,292,000	5,853,694	10,860	7,456
Applied Optimized SNCR/ASOFA	0.33	21	2,301,440	158,339	1,833,000	1,991,339	94,826	
Existing SNCR/ASOFA	0.332	Baseline						

SCR O&M costs are less than for the existing SNCR system due to lower reagent costs. At less than \$2,000/ton, replacing the existing SNCR with SCR on MRYS Unit 1 could be very cost-effective.

Applied RRI + SNCR/ASOFA has a greater annual cost than SCR and reduces fewer emissions; this option should be discarded if SCR is considered. The analysis then becomes:

Table 27. NPS Revision 2 to B&M Table 2-8: Annualized Total Cost of MRYS Unit 1 NO_x Control Technologies (2019\$)

NO _x Control Alternative	Emission Rate (lb/mmBtu)	Annual Emission Reduction (tpy)	Installed Capital Cost	Capital Recovery Cost (\$)	Annual O&M Cost (\$)	Annualized Total Cost (\$)	Actual Unit Control Cost (\$/ton)	Incremental Unit Control Cost (\$/ton)
SCR	0.05	3,961	103,534,350	5,456,260	-2,107,972	3,356,906	1,857	347
Applied Optimized SNCR/ASOFA	0.33	21	2,301,440	158,339	1,833,000	1,991,339	94,826	
Existing SNCR/ASOFA	0.332	Baseline						

The incremental cost-effectiveness of replacing the existing SNCR with SCR on MRYS Unit 1 is also very reasonable.

Table 28. NPS Revision to B&M Table 2-9: Annualized Total Cost of MRYS Unit 2 NO_x Control Technologies (2019\$)

N0 _x Control Alternative	Emission Rate (lb/mmBtu)	Annual Emission Reduction (tpy)	Installed Capital Cost	Capital Recovery Cost (\$)	Annual O&M Cost (\$)	Annualized Total Cost (\$)	Actual Unit Control Cost (\$/ton)	Incremental Unit Control Cost (\$/ton)
SCR	0.04	6,738	170,493,978	8,985,033	-624,003	8,373,549	1,658	207
Applied RRI+SNCR/ASOFA	0.26	1271	14,005,800	963,599	6,278,000	7,241,599	5,698	5,350
Applied Optimized SNCR/ASOFA	0.32	240	3,323,200	228,636	1,497,000	1,725,636	7,190	
Existing SNCR/ASOFA	0.334	Baseline						

SCR O&M costs are less than for the existing SNCR system due to lower reagent costs. At less than \$2,000/ton, replacing the existing SNCR with SCR on MRYS Unit 2 could be very cost-effective.

Applied RRI + SNCR/ASOFA and SNCR Optimization are also viable options.

– Time Necessary for Compliance (Statutory Factor 2)

NDDEQ: The time necessary for compliance is not a limiting factor when determining additional reasonable controls for MRYS Unit 2 NO_x emissions since SNCR optimization and/or RRI could be installed prior to the end of the second planning period.

– Energy and Non-Air Quality Environmental Impacts (Statutory Factor 3)

ENERGY

NDDEQ: The primary energy impact of utilizing RRI with SNCR or optimizing existing SNCR system is reduced boiler efficiency due to evaporation of large amounts of dilute urea. This results in excess coal needing to be burned to evaporate the expected amount of dilute urea in the boiler. An incremental increase in energy will also result from providing more compressed air for reagent atomization.

Auxiliary power requirements result in a 66 kW increase in an optimized SNCR, and a 132 kW increase with RRI and SNCR. These energy impacts are only incrementally higher than the existing system, and do not remove either option from consideration.

NPS: Energy impacts are addressed under statutory factor 1, cost of compliance.

NON-AIR QUALITY ENVIRONMENTAL IMPACTS

NDDEQ: Non-air quality impacts of the control technologies are very similar to the impacts of the existing SNCR system. There may be an increase in ammonia slip, but a majority will be captured in the WFGD system. There will also be additional reverse osmosis/condensate waste due to the increase in demand from the systems and the need to dilute concentrated urea. This would result in millions of gallons of additional water treatment wastewaters being discharged from the MRYS facility on an annual basis. These impacts are considered acceptable and do not remove either option from consideration.

NPS: The impacts raised are standard to the operation of this control technology.

– Remaining Useful Life (Statutory Factor 4)

NDDEQ: Based on the information provided to the Department, MRYS is expected to operate beyond the life of the control equipment. Therefore, remaining useful life was not considered.

3.4.5 Conclusions & Recommendations

- Other states have set cost-effectiveness thresholds of: \$5,000/ton for EGUs in AR and TX, \$7,000/ton in NM, and \$10,000/ton in CO and OR.
- The cost effectiveness of modifying the existing scrubbers at MRYS would be acceptable in the context of the previous ND BART thresholds as well as the thresholds used by the states cited. This strategy could reduce SO₂ emissions by over 1,600 tons/year compared to existing controls.
- The annual average and incremental cost-effectiveness of adding RRI at MRYS Unit 2 would be acceptable in the context of the thresholds used by CO, NM, and OR. This strategy could reduce NO_x emissions by over 3,500 tons/year compared to existing controls.
- The annual average cost effectiveness of adding SCR at MRYS would be acceptable in the context of the previous ND BART thresholds as well as the thresholds used by the states cited. This strategy could reduce NO_x emissions by over 10,700 tons/year compared to existing controls.

3.5 Leland Olds Station

3.5.1 Summary of NPS Recommendations and Requests for Leland Olds Station

The NPS review of the four-factor analysis conducted for Leland Olds Station (LOS) finds that there are technically feasible and cost-effective opportunities available to further control NO_x emissions from Unit 2. In fact, we find that the cost of control is more economical than the SIP estimate when analyses are adjusted in accordance with the EPA Cost Control Manual.

In addition, our review of recent emissions data from LOS revealed two areas of concern. First, emissions data from the EPA Air Markets Program indicate that January 2021 mercury emissions were 5.02 lb/TBtu at LOS Unit 2. This is extremely concerning given the Mercury and Air Toxics Standard for existing boilers firing low rank virgin coal is 4.0 lb/TBtu. Secondly, the

SO₂ emission rate from LOS Unit 1, while low compared to historic rates, has been steadily increasing since 2014. We request that NDDEQ investigate these matters and take action to reduce mercury emissions from LOS Unit 2 and optimize SO₂ control efficiency for LOS Unit 1.

Although ND has not established a cost threshold for this round of regional haze planning, we can advise that other states have set cost-effectiveness thresholds of: \$5,000/ton for EGUs in AR and TX, \$7,000/ton in NM, and \$10,000/ton in CO and OR.

The annual average cost-effectiveness of adding SCR to reduce NO_x emissions at LOS Unit 1 would exceed the thresholds used by all states we have seen. However, there are two opportunities to cost-effectively reduce NO_x emissions from Unit 2. 1) The annual average cost effectiveness of adding Rich Reagent Injection (RRI) to SNCR at LOS Unit 2 would be acceptable in the context of the previous ND BART thresholds as well as thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by almost 1,200 tons/year. 2) The annual average cost effectiveness of adding SCR at LOS Unit 2 would also be acceptable in the context of the previous ND BART thresholds as well as thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by over 3,500 tons/year compared to existing controls.

We recommend that ND take every opportunity to reduce NO_x emissions from the Leland Olds Station in this planning period. By requiring implementation of identified controls ND will be reducing haze causing emissions and advancing incremental improvement of visibility at Theodore Roosevelt, Badlands, and Wind Cave National Parks as well as other Class I areas in the region.

3.5.2 Leland Olds Plant Characteristics

Leland Olds Station (LOS) is a 656 MW lignite coal-fired power station owned and operated by Basin Electric Power Cooperative (Basin) near Stanton, North Dakota. Theodore Roosevelt National Park, a Class I area administered by the National Park Service (NPS), is 149 km west of this facility.

Of 1,167 facilities in EPA's Clean Air Markets Database (CAMD) in 2020, LOS ranked #105 for sulfur dioxide (SO₂) emissions (1,720 tons) and #48 for nitrogen oxides (NO_x at 4,420 tons). LOS' carbon dioxide emissions of 3,784.483 tons rank #111 in the US. LOS also ranked #41 for EGU mercury (Hg) emissions with 82 lb in 2017.

LOS has two generating units (Units 1 and 2) that burn lignite from the Freedom Mine operated by Dakota Coal. LOS Unit 1 is a 216 MW Babcock and Wilcox (B&W) opposed wall-fired unit that went online in 1966. LOS Unit 1 is equipped with an Emerson combustion optimizer, Low-NO_x burners (LNB), advanced separated overfire air (SOFA) and selective non-catalytic reduction (SNCR) for NO_x control, wet limestone flue gas desulfurization (WFGD) system for SO₂ control, and electrostatic precipitators (ESP) for particulate matter (PM) control. LOS Unit 2 is a 440 B&W cyclone-fired unit that went online in 1975. LOS Unit 2 is equipped with an Emerson combustion optimizer, SOFA, and SNCR for NO_x control, WFGD for SO₂ control, and ESP for PM control. Mercury is controlled by Powdered Activated

Carbon Sorbent Injection.²² The Table 29 below shows a breakdown of 2020 SO₂ and NO_x emissions and how they rank versus the 3,317 EGUs in CAMD.

Table 29. LOS 2020 SO₂ and NO_x emissions and rank versus the 3,317 EGUs in CAMD

Unit ID	SO ₂ (tons)	SO ₂ (tons) Rank	Avg. SO ₂ Rate (lb/MMBtu)	Avg. SO ₂ Rate (lb/MMBtu) Rank	NO _x (tons)	NO _x (tons) Rank	Avg. NO _x Rate (lb/MMBtu)	Avg. NO _x Rate (lb/MMBtu) Rank
1	484	301	0.103	296	660	306	0.137	514
2	1,236	167	0.098	307	3,760	20	0.285	120

3.5.3 First Planning Period Regional Haze Control Requirements for LOS 1 and 2

Basin Electric's LOS Units 1 and 2 were evaluated by the NDDEQ as subject-to-BART (Best Available Retrofit Technology) sources. NDDEQ concluded that BART for both LOS units included new WFGD for SO₂ control and SOFA with SNCR for NO_x control. NDDEQ determined that selective catalytic reduction (SCR) was not an available, and thus not a technically-feasible, option.

On September 21, 2011, EPA proposed to partially approve and partially disapprove specific aspects the Regional Haze SIP. EPA proposed to disapprove the State's determination of BART for LOS Unit 2 and approve the State's BART determination for SO₂ control at LOS (i.e., new WFGD) and the NO_x BART determination for LOS Unit 1 (i.e., SOFA+SNCR). EPA also proposed the promulgation of a Federal Implementation Plan (FIP) which included a NO_x BART determination and emission limits for LOS Unit 2. EPA proposed advanced SOFA (ASOFA) plus SCR and an emission rate of 0.07 lb/MMBtu (30-day rolling average) as BART for NO_x control on LOS Unit 2.

EPA issued its Final Rule on April 6, 2012 and reversed its position regarding the technical feasibility of SCR on LOS Unit 2 and decided to approve the State's BART determination for NO_x control on LOS Unit 2.

EPA's decision to accept the BART determinations for LOS Unit 2 was based primarily on the decision in United States v. Minnkota Power Cooperative, Inc. which concluded that the State's best available control technology (BACT) analysis for NO_x control on Minnkota Power's Milton R. Young Station (MRYS) Units 1 and 2 was not unreasonable, a conclusion that was contrary to EPA's position at the time of the Proposed FIP. EPA noted that the technical feasibility determination under the BACT and BART analyses was substantially the same, and that the BART Guidelines permit a state to rely upon a BACT determination for purposes of selecting BART unless new technologies have become available or best control levels for recent retrofits

²² The Mercury and Air Toxics Standard for existing boilers firing low rank virgin coal is 4.0 lb/TBtu. January 2021 Hg emissions were: Unit 1= 1.01 lb/Trillion Btu (TBtu), Unit 2 = **5.02** lb/TBtu.

have become more stringent. EPA concluded that it would be inappropriate to proceed with its proposed disapproval of SNCR as BART and approved the State's determination that ASOFA+SNCR and an emission rate of 0.35 lb/MMBtu (30-day rolling average) was BART for NO_x control on LOS Unit 2.

The BART selected by NDDEQ for LOS Unit 1 and Unit 2 was WFGD for SO₂ control and SOFA and SNCR for NO_x control with a compliance date of April 4, 2017. A 0.15 lb SO₂/MMBtu or 95% SO₂ removal on a 30-day rolling average limit was placed on each LOS Unit, which corresponds with the Presumptive BART SO₂ control level proposed by EPA for a WFGD. A NO_x limit of 0.19 lb/MMBtu and 0.35 lb/MMBtu on a 30-day rolling average was placed on LOS Units 1 and 2, respectively.

The WFGD systems for Units 1 and 2 were placed in early operation in 2012 (LOS Unit 2) and 2013 (LOS Unit 1), due to the increasing sulfur content of the fuel supply. The layered NO_x control systems were placed in service in stages over several years with the systems fully in service and optimized in 2016 for both units. Changes in emissions resulting from these actions are shown in the charts below.

Figure 18. LOS Unit 1, Calculated Avg. SO₂ Rate (1980–2020)

Figure 19. LOS Unit 1, Calculated Avg. NO_x Rate (1985–2018)

3.5.4 Second Planning Period Reasonable Progress Control Requirements for LOS 1 and 2

NDDEQ: The NDDEQ sent a letter to Basin on May 2, 2018 requesting a four-factor analysis (4FA) for LOS. The letter required that Basin's 4FA be submitted to the NDDEQ by January 31, 2019.

In January 2019, Sargent & Lundy LLC (S&L) prepared a 4FA for the LOS on behalf of Basin. The analysis included an assessment of potentially available SO₂ and NO_x emission reduction technologies that could be applied to LOS Units 1 and 2.

Basin's original 4FA was submitted to the NDDEQ on January 31, 2019. The NDDEQ provided comments to Basin regarding Basin's 4FA on April 15 and April 22, 2019. Basin submitted a response to the NDDEQ's comments on July 26, 2019. On November 20, 2019, Basin submitted an update to the steam cost that was used to develop the operating costs for the technically feasible NO_x reduction technologies. Based on the information reviewed, future operations and emissions profiles are expected to remain consistent with current conditions.

NPS: 2020 fuels data from the Energy Information Administration shows the average sulfur content of the lignite burned at LOS would result in uncontrolled SO₂ emissions of 2.08 lb/mmBtu.²³ CAMD data for LOS in 2020 showed that controlled SO₂ emissions averaged 0.103 lb/mmBtu at Unit 1 and 0.098 lb/mmBtu at Unit 2. However, Unit 1 emission rates have been increasing recently.

Figure 20. LOS Unit 1 SO₂ emission rates have been increasing recently (2014–2020)

²³ Average sulfur content was 0.97% with an average heat content of 13.25 mmBtu/ton.

Following are excerpts from the January 2019 S&L report—we note where we have differences.

SO₂ Emissions Controls

IDENTIFY AVAILABLE SO₂ CONTROL OPTIONS

As part of the first planning period for Regional Haze, the NDDEQ concluded that WFGD for SO₂ control was BART for LOS Units 1 and 2. For the Round II Determination's 4FA presented in this report, the NDDEQ requested Basin Electric evaluate improvements or upgrades to the existing WFGD systems that could be made to reduce SO₂ emissions further.

TECHNICAL FEASIBILITY OF AVAILABLE SO₂ CONTROL OPTIONS

Operational Improvements and Equipment Upgrades on Existing WFGD

Limestone Quality

The LOS WFGD byproduct is currently disposed, as such using a lower quality limestone is acceptable. The facility on average receives 90% or greater CaCO₃ content, which is on the high end of quality for generating WFGD byproduct for disposal. Procuring a higher CaCO₃ content limestone would not provide any valuable improvement in WFGD performance. Thus, changing the limestone quality is not a technically feasible SO₂ control option for LOS, and will not be evaluated further.

Ca:S Stoichiometric Ratio

S&L reviewed limestone addition data provided by LOS for Units 1 and 2. At LOS Unit 1, limestone feed rate is maintained relatively close to the maximum design stoichiometry based on the inlet SO₂ concentration. Increasing the fresh limestone addition rate to operate closer to the maximum design stoichiometry could provide nominal additional SO₂ removal. Further increases to limestone consumption beyond the design rate are not recommended, due to potential harmful effects of changes of slurry pH, which can lead to scaling concerns and oxidation-reduction potential (ORP) issues. LOS has already had issues with pH control and limestone addition beyond the design rate may drive the pH too high. As such, an increase in Ca:S stoichiometry to the design is considered to be a technically feasible SO₂ control option for LOS Unit 1. This adjustment to station work practices would require a slight increase in limestone addition to achieve an 11% reduction from the baseline SO₂ hourly rate (in lb/hr).

A similar analysis was conducted on Unit 2 limestone addition rates. Similarly, there is minor improvement to achieve maximum design stoichiometry at full load based on the inlet sulfur. It is not recommended to increase the rates above design, due to the aforementioned effects of operating outside of design pH range. However, increasing stoichiometry would have to be done in conjunction with increasing the L/G ratio. The L/G, which is a measurement of the volume of liquid slurry recycled in comparison to the volumetric flow rate of gas passing through the absorber, also typically has an effect on removal efficiency. Since the limestone injection rate and the L/G ratio rely upon each other for the system to operate as designed, it is difficult to predict performance improvement with increased limestone alone. As such, for LOS Unit 2, increased limestone stoichiometry will be reviewed in conjunction with increasing the L/G ratio as discussed in the next section.

Liquid-to-Gas Ratio

S&L estimated recycle slurry flow rates based on pump operating data provided by LOS for Units 1 and 2. Based on the data provided, the Unit 1 pumps operate with three of the four spray levels always in service. Current industry practice for WFGD systems are such that the system is designed with a spare recycle pump and spray level in order to maintain SO₂ removal while performing maintenance activities on the recycle pumps. Furthermore, the recycle flow rate data suggest that all Unit 1 operating pumps are working at their maximum capacity at all times. This was confirmed by LOS operating personnel that explained that the recycle pumps are manually operated and not adjusted for operating load or SO₂ loading. This suggests there is no potential for increased L/G ratio without major modifications to the spray headers. For these reasons, changes to L/G ratio are not considered to be a technically feasible SO₂ reduction option for LOS Unit 1 and will not be evaluated further.

As mentioned in the previous section, Unit 2 is not operating at its maximum design L/G ratio. The design of the Unit 2 WFGD is based on four of five recycle pumps operating at maximum flow at full load, to satisfy the design operating profile; however, the facility has only been operating three at a time, due to lower inlet sulfur loading than design (3.9 lb/MMBtu) and is still maintaining SO₂ emissions below the permitted limit. Fuel forecasts suggest that the inlet sulfur loading could increase to 3.73 lb/MMBtu on a short-term basis, within the next 5-10 years, from the baseline SO₂ fuel composition of 3.05 lb/MMBtu for Unit 2. As the facility starts to burn higher sulfur coal in comparison to the recent historical quality, the site personnel can manually place the fourth pump in service.

However, based on review of data provided by LOS, the flow rate of the pumps that are in operation is less than design, which is mainly due to the rigorous required maintenance to keep them at full efficiency and design flow rate. If the pumps are increased to maximum design capacity and the limestone is increased to the appropriate ratio (as referenced in the previous section), the Unit 2 WFGD would be expected to achieve a nominal reduction in SO₂ emissions at full load. For these reasons, operating changes resulting in an increase in Ca:S stoichiometry in conjunction with an increase in L/G is considered to be a technically feasible SO₂ control option for LOS Unit 2 and will be evaluated further. It is expected that the adjustment to station work practices may achieve a 15% reduction from the baseline SO₂ hourly rate (in lb/hr).

Additional Spray Level

Another method to increase L/G ratio in a WFGD system is to increase the amount of spray levels. As mentioned previously, Units 1 and 2 are designed with a spare spray level to account for a certain level of redundancy for maintenance purposes. If increased L/G ratio cannot be obtained by increasing the throughput of slurry through the existing spray headers, an additional recycle pump and spray header may be added. An additional spray level would increase the L/G ratio by 33% on Unit 1 and 20% on Unit 2.

The original equipment manufacturer (OEM) provided correction curves that suggest an additional 1% removal efficiency could be achieved with all pumps and spray levels in service at both LOS units. As such, it is expected that installing an additional spray level would improve LOS Unit 1 and 2 performance. However, S&L reviewed the absorber drawings for each unit

and concludes there is no room for an additional slurry spray level. Due to the location of the mist eliminators which are directly above the highest spray level and the inlet flue gas duct located directly below the first spray level, there is no room to install another spray level unless the top of the absorber is extended to make room for another spray level. All of the internals in this section would need to be restructured including the outlet cone ductwork to the chimney. For these reasons, an additional spray header is not considered to be a technically feasible SO₂ control option for LOS Unit 1 or 2 and will not be evaluated further.

Optimized Spray Level Coverage

S&L consulted the WFGD OEM to determine if there have been any developments in spray header design since the LOS WFGD's were installed. The OEM concluded that the LOS WFGD systems were originally designed with state-of-the-art spray coverage and up/down nozzle patterns, which is consistent with the most modern WFGD systems. As such no additional improvements could be made to the spray nozzle design to improve the WFGD efficiency. For these reasons, optimizing the spray nozzle design is not considered to be a technically feasible SO₂ control option for LOS Unit 1 or 2, and will not be evaluated further.

pH Buffer Additive

The use of DBA in conjunction with increasing fresh limestone injection rates is expected to provide the WFGD with an additional 1% SO₂ removal efficiency. This performance could be obtained for the expected fuel sulfur content up to 3.73 lb/MMBtu. The facility is currently equipped with two common limestone ball mills, one operating and one spare, and a forwarding system with four slurry pumps. Based on the maximum future fuel sulfur content, the ball mills and slurry forwarding systems have sufficient capacity to provide the additional limestone required for Units 1 and 2 while still maintaining complete redundancy. Additional equipment for the DBA addition system would require a small tank and pump to add to the slurry holding tank. As such, DBA and increased limestone makeup is determined to be a technically feasible option for providing additional SO₂ removal efficiency on LOS Units 1 and 2.

– Cost of Compliance (Statutory Factor 1)

S&L for LOS: Capital costs were annualized using a capital recovery factor based on an annual interest rate of 5.25% and equipment life of 20 years.

NPS: The CCM recommends use of the current prime interest rate of 3.25% and 30-year life.

S&L for LOS: Capital and O&M cost estimates were developed for each of the technically feasible SO₂ control options. The LOS Units 1 and 2 cost estimates are conceptual in nature; thus, S&L did not procure equipment quotes specifically for the Units 1 and 2 control system upgrades. Rather, equipment costs are based on conceptual designs developed for the retrofit control systems, preliminary equipment sizing developed for the major pieces of equipment (based on Units 1 and 2-specific design parameters, including typical fuel characteristics, full load heat input, and flue gas temperatures and flow rates), and recent pricing for similar equipment. S&L would characterize the cost estimates for the LOS Units 1 and 2 retrofit technologies as “concept screening” cost estimates generally based on parametric models, judgment, or analogy.

Control technology equipment costs for the retrofit options were developed by scaling cost estimates prepared by S&L for other similar projects. Major equipment costs were developed based on equipment costs recently developed for similar projects, and include the equipment, material, labor, and all other direct costs needed to retrofit the units with the control technology. Sub-accounts for the capital cost estimates (e.g., mobilization and demobilization, consumables, contractor general and administrative (G&A) expense, freight on materials, etc.) were developed by applying ratios from detailed cost estimates that were prepared for projects with similar scopes.

NPS: The LOS four-factor analysis applies a 20% Contingency Cost of Direct and Indirect capital costs to all capital cost analyses. The CCM says:

The contingency, C, accounts for unexpected costs associated with the fabrication and installation of the absorber and is calculated by multiplying the total direct and indirect costs by a contingency factor (CF). A default value of 10% is typically used for CF.

The four-factor analyses also applied 2% of Direct cost as owner's costs—this is not allowed by EPA.

S&L for LOS: Fixed O&M costs include operating labor, maintenance labor, maintenance material, and administrative labor. Variable O&M costs include the cost of consumables, including reagent, water consumption, and auxiliary power requirements. Auxiliary power requirements reflect the additional power requirements associated with the operation of the new control technology (compared to the existing technology). All O&M costs reflect the incremental increase in O&M costs compared to the costs incurred to operate the existing WFGD systems.

NPS: The cost analysis spreadsheet contained property taxes not assessed by ND.

NDDEQ presented LOS four-factor analysis results in Tables 30 and 31 below.

Table 30. (NDDEQ draft SIP Table 16) SO₂ Cost of Compliance and Incremental Cost of Compliance (Unit 1)

Control Technology	Performance Rate (lb SO ₂ /MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)	Incremental Cost of Compliance (\$/ton)
WFGD (Baseline)	0.09				
Ca:S Stoichiometry	0.08	59	752,000	12,698	
pH Buffer Additive	0.06	237	4,441,865	18,742	20,730

Table 31. (NDDEQ draft SIP Table 17) SO₂ Cost of Compliance and Incremental Cost of Compliance (Unit 2)

Control Technology	Performance Rate (lb SO ₂ /MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)	Incremental Cost of Compliance (\$/ton)
WFGD (Baseline)	0.09				
Ca:S Stoichiometry and L/G Ratio	0.08	128	1,439,000	11,264	
pH Buffer Additive	0.05	464	7,740,386	16,682	18,754

– Time Necessary for Compliance (Statutory Factor 2)

Control Technology	Total time after SIP approval (months)
Ca:S Stoichiometry	3
pH Buffer Additive	12

– Energy and Non-Air Quality Environmental Impacts (Statutory Factor 3)

ENERGY

NDDEQ: Adjustment of the Ca:S stoichiometric ratio would require an increased operation of the recycle pump, which will increase the auxiliary power requirements. This would adversely affect the net plant heat rate. This impact is significant but not significant enough to eliminate adjustment of the Ca:S stoichiometric ratio as a control option.

NPS: This should be included in the cost analysis under statutory factor 1, cost of compliance.

NON-AIR QUALITY ENVIRONMENTAL IMPACTS

NDDEQ: There are no known significant non-air quality environmental impacts associated with any of the technically feasible SO₂ control technologies.

– Remaining Useful Life (Statutory Factor 4)

NDDEQ: Based on the information provided to the NDDEQ, LOS is expected to operate beyond the life of the control equipment. Therefore, remaining useful life was not considered.

NO_x Emission Controls

SELECTIVE CATALYTIC REDUCTION (SCR)

NDDEQ: Successful use of TE-SCR controls has since been demonstrated at existing bituminous- and subbituminous-fired units. Even though this has not been demonstrated on

North Dakota lignite-fired boilers, the current determination is deeming TE-SCR as being technically feasible for Unit 1 at LOS, which is an opposed wall-fired boiler. TE-SCR is anticipated to provide an approximately 69% reduction in NO_x emissions from the baseline scenario on Unit 1. This would lower the expected performance rate from 0.16 to 0.05 lb NO_x per MMBtu for Unit 1. TE-SCR is assumed to be technically feasible for installation on Unit 1 at LOS and will be evaluated further. The earlier determination focused on North Dakota lignite-fired cyclone boilers. Therefore, SCR is not considered technically feasible for Unit 2 at LOS.

NPS: Tail-End SCR should be able to reduce NO_x emissions by at least 77% on Unit 1 and 87% on Unit 2 to achieve 0.04 lb/mmBtu. For example, EPA assumed in 2014 that SCR could achieve the 0.04 lb/mmBtu annual emissions proposed by Basin at its Laramie River Station in WY. 2020 CAMD data contains 11 coal-fired EGUs with SCR at 0.04 lb/mmBtu annual average.

OPTIMIZED SELECTIVE NON-CATALYTIC REDUCTION

S&L for LOS: SNCR involves the direct injection of ammonia or urea ((NH₂)₂CO) at high flue gas temperatures (approximately 1,600°F – 2,100°F) in an oxidizing environment. The ammonia or urea reacts with NO_x in the flue gas to produce N₂ and water as shown below.

Flue gas temperature at the point of reagent injection can greatly affect NO_x removal efficiencies and the quantity of ammonia or urea that will pass through the SNCR unreacted (referred to as ammonia slip). In general, SNCR reactions are effective in the range of 1,600°F – 2,100°F. At temperatures below the desired operating range, the NO_x reduction reactions diminish and unreacted NH₃ emissions increase. Above the desired temperature range, NH₃ is oxidized to NO_x resulting in low NO_x reduction efficiencies.

Mixing of the reactant and flue gas within the reaction zone is an important factor to SNCR performance. Retractable multi-nozzle lances (MNLs) are sometimes used to improve SNCR performance, especially if the furnace exit flue gas temperatures are too high. The retractable lances allow injection into the appropriate temperature zone more so than wall injectors, depending on the unit load and temperatures. The MNLs also help improve performance by refining the spray pattern for quicker vaporization of the conveying water. MNLs are often used in conjunction with wall injection to provide optimized coverage while reducing reagent cost.

For LOS Unit 1, SNCR boiler computational fluid dynamics (CFD) modeling was completed to understand the best performance expected prior to implementation and tuning of the system. Based on the SOFA, LNB, and combustion optimization systems, SNCR was predicted to achieve 20% removal with an outlet NO_x rate just over 0.17 lb/MMBtu. Based on flow and NO_x CEMS data, average performance of the SNCR is currently slightly below 0.17 lb/MMBtu. As such, the current SNCR system is considered fully optimized based on the expected CFD modeling; any additional urea injection may result in negative impacts with ammonia slip emissions. Also, MNLs were initially modeled in addition to the wall injectors and were found to improve removal efficiency by another 6%; however, the optimal locations of the MNLs were

determined to have physical interferences which would have limited the possibility of installation and thus were not installed. As such, MNLs are considered technically infeasible as part of this evaluation. For these reasons, SNCR optimization is not considered to be a technically feasible NO_x control option for LOS Unit 1 and will not be evaluated further.

NPS: We estimate that SNCR on LOS Unit 1 is achieving 30% control.

S&L for LOS: As discussed previously, the SNCR on LOS Unit 2 was implemented after SOFA tuning, combustion optimization, and four vent ports were relocated. As such, the pre-SNCR baseline emission rate is much lower than the 0.67 lb/MMBtu uncontrolled baseline reported in the First Implementation Phase. S&L and Basin Electric consulted SNCR OEMs to determine the expected SNCR performance for a cyclone boiler similar to LOS Unit 2, considering the pre-SNCR baseline. The OEM, who performed a significant amount of modeling when the SNCR system was being designed on Unit 2, suggested that the SNCR system could be further optimized. Improvement of the stoichiometry would be required, by relocating all cyclone vent ports. Additionally, due to revised temperatures within the boiler from the new SOFA, vent port relocations, and combustion optimizers, the current urea injection lances are recommended to be relocated for better utilization of the reagent.

NPS: We estimate that SNCR on LOS Unit 2 is achieving 4% control.

S&L for LOS: By optimizing LOS Unit 2's SNCR system based on additional vent port relocation and SNCR injection lance relocation, the unit may be able to achieve an additional 10% reduction from the annual baseline NO_x rate or approximately 0.27 lb/MMBtu at the boiler outlet at full load. This is consistent with greater than 25% reduction from an estimated pre-SNCR NO_x rate. In this case for LOS Unit 2, the limiting factor for optimized SNCR operation is full load. Overall, it is expected that optimization of the Unit 2 SNCR system at all loads is a technically feasible option to reduce NO_x emissions and will be evaluated further.

RICH REAGENT INJECTION

Similar to SNCR, the concept of RRI is to use a nitrogen-containing additive (urea) injected into a reducing environment to promote peak NO_x reduction efficiency. RRI is a commercial technology for cyclone boilers only, thus is not an applicable option for LOS Unit 1. In contrast to SNCR, RRI typically is applied with only one injection level in the lower furnace near the cyclone barrels (temperature window of 2000°F-2600°F). The technology requires a sub-stoichiometric oxygen concentration near the barrels at <0.95. This allows for a higher injection rate of reagent without oxidizing to NO_x due to the sub-stoichiometry. Injection at this location also creates lower level of excess NH₃ emissions (ammonia slip), while injecting at an NSR of 2.0-3.0.

The RRI process is a commercially available process and has been predicted to typically reduce NO_x emissions by 20-40% at full load with no ammonia slip, but is highly dependent on the stoichiometry. However, this technology provides the most beneficial reduction at full load, due to the cyclone temperature window and stoichiometry. At mid- and low-loads, the predicted reduction is less than the current SNCR baseline operation at these loads. Therefore, low load

operation is considered the limiting factor of RRI alone and the effectiveness of RRI is marginalized at mid-loads. SNCR would still be needed to achieve a similar reduction at low load. As such, RRI on its own is not a technically feasible NO_x reduction technology due to its limited operating conditions throughout all load ranges and will not be considered further.

OPTIMIZED SNCR + RRI

While RRI alone will provide beneficial NO_x reduction at full load only, coupling RRI with SNCR will provide a balanced approach to NO_x reduction through all load ranges. RRI and SNCR injectors are located at different elevations of the furnace and in different temperature windows. The system utilizes a high urea injection rate, staged at multiple locations throughout the boiler. The main advantage of this combined system is that the SNCR can provide better NO_x reduction at mid- and low-loads and at a lower NSR than RRI alone. Therefore, this combined system is expected to be able to provide a lower emission rate through all load ranges.

Boiler CFD modeling of the SNCR and RRI systems was previously conducted with different assumptions of SOFA and vent port relocation performance. However, S&L consulted the CFD modeling company to provide insight into what performance could be achieved with the revised pre-SNCR baseline NO_x emission rate. This information was also provided to an SNCR+RRI system OEM who suggested that an additional 43% reduction from the annual baseline could be guaranteed at full load, which would provide an outlet emission rate of 0.17 lb/MMBtu. This is consistent with greater than 50% reduction from an estimated pre-SNCR NO_x rate.

Alternatively to the optimized SNCR case, low load operation is the limiting factor for SNCR+RRI performance. RRI becomes ineffective at low load and the OEM suggested that almost no NO_x reduction would occur at this load due to RRI. Initial modeling suggested that increasing the urea NSR to 3.0 at low load could achieve an additional 2% reduction, but there is a concern about ammonia slip rates with this operating profile.

The SNCR + RRI combination would require all new penetrations for the RRI system as well as the relocation of the existing SNCR system. The RRI system will require a larger urea storage tank, additional water treatment equipment for solutionizing, additional pump forwarding capacity, new piping to lower boiler elevations, additional boiler penetrations, injectors, and all balance of plant related equipment. At the lower elevation for the RRI ports, the most optimal injection location happens to occur at the same elevation of the windbox. Therefore, specialized retractable and cooled injection lances with windbox modifications would be required. This design creates engineering and operational challenges that are normally avoided by injecting reagent in more accessible areas of the boiler.

Overall, the implementation of an RRI system along with optimization of the existing SNCR system is a technically feasible NO_x control option on Unit 2. Based on input from previous CFD modeling and SNCR OEMs, it is expected that LOS Unit 2 could achieve an outlet NO_x rate of 0.22 lb/MMBtu with an ammonia slip of 10 ppmvd with vent port relocation, optimized SNCR, and RRI.

GAS REBURN

Gas reburn is a retrofit technique that has been used to control NO_x emissions from coal- and oil-fired boilers. Gas reburn involves combustion in three distinct zones within the boiler: (1) a primary combustion zone, where the primary fuel is fired using conventional burners; (2) a reburn zone, where secondary fuel, typically natural gas, is introduced into the boiler; and (3) an overfire air burnout zone. Lack of natural gas available on site precludes the ability to test and implement this control option on LOS Units 1 and 2, which use fuel oil as the startup fuel. As such, gas reburn is not considered a technically feasible NO_x control technology at LOS Units 1 and 2.

– Cost of Compliance (Statutory Factor 1)

S&L for LOS: The economic analysis performed as part of the four-factor analysis examines the cost-effectiveness of each technically feasible control technology, on a dollar per ton of pollutant removed basis. Capital costs and lost revenues were annualized using a capital recovery factor based on an annual interest rate of 5.25% and equipment life of 20 years.

NPS: The CCM recommends use of the current prime interest rate (3.25%) and equipment lives of 20 years for SNCR and 30 years for SCR.

S&L for LOS: Capital and O&M cost estimates were developed for each of the technically feasible NO_x control options. The LOS Units 1 and 2 cost estimates are conceptual in nature; thus, S&L did not procure equipment quotes specifically for the Units 1 and 2 control system upgrades. Control technology equipment costs for the retrofit options were developed by scaling cost estimates prepared by S&L for other similar projects.

NPS: The four-factor analysis for LOS applied a 20% Contingency Cost of Direct and indirect capital costs to all capital cost analyses. The CCM says:

The contingency, C, accounts for unexpected costs associated with the fabrication and installation of the absorber and is calculated by multiplying the total direct and indirect costs by a contingency factor (CF). A default value of 10% is typically used for CF.

The four-factor analysis additionally applied 2% of direct cost as owner's costs which are not allowed by EPA.

S&L for LOS: Fixed O&M costs include operating labor, maintenance labor, maintenance material, and administrative labor. Variable O&M costs include the cost of consumables, including reagent, water consumption, and auxiliary power requirements. Auxiliary power requirements reflect the additional power requirements associated with the operation of the new control technology (compared to the existing technology). All O&M costs reflect the incremental increase in O&M costs compared to the costs incurred to operate the existing SNCR systems.

NPS: The LOS four-factor analysis included Property Taxes = 1% of TCI; Insurance = 1% of TCI; and Administration = 2% of TCI. The CCM says:

Property taxes and overhead are both assumed to be zero, and insurance costs are assumed to be negligible. Thus, administrative charges and capital recovery are the only components of indirect annual costs estimated in this analysis.

NDDEQ: The cost of compliance and incremental cost for the reasonable progress controls are listed in Table 10 (Unit 1) and Table 11 (Unit 2).

Table 32. (NDDEQ draft SIP Table 10) NO_x Cost of Compliance and Incremental Cost of Compliance (LOS Unit 1)

Control Technology	Performance Rate (lb/MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)
LNB/SNCR/SOFA (Baseline)	0.16			
TE-SCR	0.05	796	33,663,928	42,316

Table 33. (NDDEQ draft SIP Table 11) NO_x Cost of Compliance and Incremental Cost of Compliance (LOS Unit 2)

Control Technology	Performance Rate (lb/MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)	Incremental Cost of Compliance (\$/ton)
SNCR/SOFA (Baseline)	0.29				
Optimized SNCR	0.27	258	924,151	3,582	
Optimized SNCR + RRI	0.22	931	5,402,503	5,801	6,650

A detailed breakdown of the costs listed in Table 10 and Table 11 can be found in Basin's submitted four-factor analysis. The Department has reviewed these costs and believes them to be accurate.

NPS: We based our estimates for the incremental costs and benefits of SCR for Unit 1 (versus the existing SNCR) on SNCR and SCR cost models developed by S&L and incorporated into the CCM by EPA. Our Table 34 (Revised NDDEQ Table 10) is presented below and our calculations have been provided.

Table 34. NPS Revised NDDEQ draft SIP Table 10: NO_x Cost of Compliance and Incremental Cost of Compliance (LOS Unit 1)

Control Technology	Performance Rate (lb/MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)
LNB/SNCR/SOFA (Baseline)	0.16			
TE-SCR	0.04	393	4,487,987	11,420

We based our estimates for the incremental costs and benefits of SCR for Unit 2 (versus the existing SNCR) on SNCR and SCR cost models developed by S&L and incorporated into the CCM by EPA. For SNCR Optimization + RRI on Unit 2, we corrected S&L's errors. Our Table 35 (revised NDDEQ Table 11) is presented below and our calculations have been provided.

Table 35. NPS Revised NDDEQ draft SIP Table 11: NO_x Cost of Compliance and Incremental Cost of Compliance (LOS Unit 2)

Control Technology	Performance Rate (lb/MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)	Incremental Cost of Compliance (\$/ton)
SNCR/SOFA (Baseline)	0.29				
Optimized SNCR	0.27	423	924,151	2,185	
Optimized SNCR+RRI	0.22	1,183	5,065,379	4,282	5,449
SCR	0.04	3,514	8,159,276	2,322	1,327

– Time Necessary for Compliance (Statutory Factor 2)

A summary of the anticipated timeline for the installation of TE-SCR on Unit 1 is provided in Table 36 (NDDEQ Table 12).

Table 36. (NDDEQ draft SIP Table 12) Time Required for NO_x Controls (LOS Unit 1)

Control Technology	Total time after SIP approval (months)
TE-SCR	52

A summary of the anticipated timelines for the optimization of SNCR and the optimization of SNCR plus RRI for Unit 2 is provided in Table 37 (NDDEQ Table 13).

Table 37. (NDDEQ draft SIP Table 12) Time Required for NO_x Controls (LOS Unit 2)

Control Technology	Total time after SIP approval (months)
Optimized SNCR	12
Optimized SNCR + RRI	16

– Energy and Non-Air Quality Environmental Impacts (Statutory Factor 3)

ENERGY

NDDEQ: The installation and operation of a TE-SCR on Unit 1 would increase the pressure drop through the control systems, which would increase the auxiliary power requirements. This would adversely affect the net plant heat rate. This impact is significant but not significant enough to eliminate TE-SCR as a control option.

NPS: We estimate the energy cost at 5% of the Total Annual Cost of SCR. This is an economic issue addressed under statutory factor 1, cost of compliance.

NDDEQ: Optimization of the SNCR and optimization of the SNCR plus RRI on Unit 2 will adversely affect the net plant heat rate due to the amount of water that will be injected with urea, which will negatively impact boiler efficiency. This impact is significant but not significant enough to eliminate optimization of the SNCR or optimization of the SNCR plus RRI as control options.

NPS: We estimate the energy cost at 1% of the Total Annual Cost of SNCR + RRI. This is an economic issue addressed under statutory factor 1, cost of compliance.

NON-AIR QUALITY ENVIRONMENTAL IMPACTS

NDDEQ: The installation and operation of the TE-SCR on Unit 1 could result in an increase in sulfur emissions due to the potential oxidation of SO₂ to SO₃ and the subsequent reaction with moisture in the stack to form H₂SO₄.

NPS: This is not an issue with the low-sulfur lignite burned at LOS.

NDDEQ: TE-SCR uses ammonia as a reagent. Ammonia slip emissions will result in the flue gas stream on the exhaust side of the control equipment due to the operation of TE-SCR (~2 ppm). Ammonia slip emissions from the operation of the TE-SCR would be emitted to the atmosphere. The non-air quality environmental impacts for TE-SCR are significant but not significant enough to eliminate either of them as a control option.

NPS: 2ppm ammonia slip is the typical limit for SCR.

– Remaining Useful Life (Statutory Factor 4)

NDDEQ: Based on the information provided to the Department, LOS is expected to operate beyond the life of the control equipment. Therefore, remaining useful life was not considered.

3.5.5 Conclusions & Recommendations

- NPS recommends that NDDEQ address the:
 - Increasing SO₂ emission rates from LOS Unit 1.
 - High mercury emission rates from LOS Unit 2.
- The annual average cost-effectiveness of adding SCR at LOS Unit 1 would exceed the thresholds used by all states we have seen.
- The annual average cost effectiveness of adding RRI to SNCR at LOS Unit 2 would be acceptable in the context of the previous ND BART thresholds as well as thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by almost 1,200 tons/year.
- The annual average cost effectiveness of adding SCR at LOS Unit 2 would be acceptable in the context of the previous ND BART thresholds as well as thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by over 3,500 tons/year compared to existing controls.

3.6 R M Heskett

It is our understanding that RM Heskett plant will cease burning coal in 2022 and install an 88 MW natural gas-fired simple-cycle combustion turbine. The permitted sum of future annual SO₂ (12 tpy) and NO_x (315 tpy) divided by the distance (185 km) to Theodore Roosevelt NP is 1.8. Because these emission reductions are certain, we agree that no four-factor analysis is needed for this facility.

3.7 Great Plains Synfuels Plant

The Dakota Gasification Company operates the Great Plains Synfuels Plant (GPSP), which is located six miles northwest of Beulah, North Dakota. The facility produces synthetic natural gas, fertilizers, and other byproducts resulting from the gasification of lignite coal. Emissions units at the facility include three Riley boilers rated at 763 MMBtu/hour apiece and two superheaters rated at 169 MMBtu/hour each that share a common stack. The facility also includes a package boiler and several flares. This one-of-a-kind facility began operation in 1984.

The boilers burn a variety of gasification products, including waste gas, stink gas, tar oil, naphtha/phenol (N/P) blend, lock gas, medium BTU purge gas, and synthetic natural gas. The boilers are equipped with low NO_x burners (LNB) and a pseudo-overfire air system for NO_x control, and there is a wet flue gas desulfurization system that removes 97% of the SO₂ from the main stack. According to the four-factor analysis, baseline emissions for the emissions units included in the analysis are 3,404 tons of SO₂/year and 2,590 tons of NO_x/year.

The four-factor analysis considered post-combustion controls to reduce NO_x emissions from the Riley boilers and superheaters. The three Riley boilers were considered as a single unit since they share a common stack, and the two superheaters were similarly considered as a single unit. According to the analysis, the concentrations of alkaline elements are not tracked in the fuels used in the boilers, but it is expected that high levels of these contaminants would make either low-dust or high-dust selective catalytic reduction (SCR) infeasible due to the potential for

catalyst poisoning. The analysis dismissed these options without providing any data on contaminant concentrations in the flue gas. The flue gas should be tested to determine conclusively whether these options are infeasible. However, the four-factor analysis did evaluate tail-end SCR as a possible option; this would allow the boiler flue gas to pass through the wet flue gas desulfurization system before reaching the SCR.

The four-factor analysis for a possible tail-end SCR system overestimated some of the costs. The EPA Control Cost Manual 7th Edition, Section 1, Chapter 2, states that *“if firm-specific nominal interest rates are not available, then the bank prime rate can be an appropriate estimate for interest rates”* for use in cost estimation. Unless there is a justification for the use of the 5.5% rate, the bank prime rate should be used. In addition, the analysis assumed a 20-year lifetime. The Control Cost Manual recommends a 30-year lifetime for SCR systems on coal-fired boilers, and 20 to 30 years for other sources. Regarding the application of tail-end SCR systems, Section 4, Chapter 2 of the manual says: “The tail-end SCRs may also have longer lifetimes due to the lower operating temperatures and lower levels of dust and SO₃.” Unless there is a justification for assuming a lower useful life for the SCR system, the assumed lifetime should be closer to 30 years. The assumption of 80% NO_x removal efficiency is low, given that many SCR systems achieve removal efficiencies > 90%. The analysis should explain why a lower value of 80% was used in for this facility. The analysis also includes owner’s costs. The EPA’s Control Cost Manual chapter on SCR states that owner’s costs are not part of the cost methodology.

The cost analysis for the tail-end SCR system does not explain in detail how some of the costs were estimated, such as the equipment costs and labor costs for installation. The four-factor analysis prepared by Sargent & Lundy says that costs for equipment, labor, and other direct costs were derived by scaling costs estimates prepared for other projects. The cost table provided in Appendix C of the four-factor analysis says that equipment and materials costs, as well as installation labor costs, were “based on Sargent & Lundy’s conceptual cost estimating system” but does not provide further details. Without this information, we are unable to fully evaluate the total system cost estimate and provide feedback. We recommend that Sargent & Lundy provide details on how these costs were derived, or revise the estimates using the cost estimate methods in the 7th edition of the Control Cost Manual and the associated Excel-based cost estimation worksheet provided by EPA.

3.8 Tioga Gas Plant

The Hess Tioga Gas Plant (TGP) is located approximately 91 km from Theodore Roosevelt National Park. The significant emission sources at the plant that were addressed in the four-factor analysis include:

- A sulfur recovery unit tail gas incinerator which is the primary SO₂ emission source at the facility during normal operations.
- Seven two-stroke lean burn (2SLB) natural gas-fired reciprocating internal combustion engines (RICE), which are the primary NO_x emission sources at the facility:

- Five engines rated at 1,920 HP. These five engines, C1A, C1B, C1C, C1E, and C1G, have not been significantly modified since installation/construction in the 1950's).
- Two engines rated at 2,350 HP. These two engines, C1D and C1F, required modification in 2004, which entailed adding turbocharging systems. The turbocharging system significantly reduced NO_x emissions from these engines compared to the other five engines. As such, these engines were not considered in the analysis.

3.8.1 SO₂ Controls for the Tioga Sulfur Recovery Unit Tail Gas Incinerator

The cost analyses for the Tioga Gas Plant SRU considered three control options:

- Flue Gas Desulfurization (FGD). This control was discussed in the cost analysis but was not brought forward in the cost analysis. NDDEQ's rationale for excluding this control option from the cost analyses was that tail gas treatment and acid gas disposal options are more effective and have less disadvantages associated with implementation.
- Tail Gas Treatment: This option was brought forward in the cost analysis.
- Acid Gas Disposal Injection Well: This option was considered in the cost analyses.

As discussed below, each of these options may be cost-effective and we recommend that one is selected to significantly to reduce SO₂ emissions from the Tioga Gas Plant in this round of regional haze planning.

FLUE GAS DESULFURIZATION (FGD)

Although it was found to be technically feasible, NDDEQ did not evaluate the costs of tail gas FGD. We recommend that a cost analysis should be completed for all technically feasible options to determine cost effectiveness relative to other technologies, as cost-effectiveness is frequently a primary determining factor in most control technology decisions. We note that the costs of wet FGD were evaluated in the four-factor analysis for a similar gas sweetening plant in Wyoming and it appears to be cost-effective. We recommend that NDDEQ include a cost analysis for a FGD retrofit.

TAIL GAS TREATMENT

Both Hess TGP and NDDEQ provided cost estimates for additional tail gas treatment units to reduce SO₂ emissions. According to Appendix A, NDDEQ's estimate was based on LO-CAT technology and resulted in a cost-effectiveness of \$11,321/ton of SO₂ removed. However, NDDEQ does not provide the detailed calculations for their cost estimates in the SIP. According to Appendix B, the analysis provided by Hess was based on Shell Claus Off-gas Treatment (SCOT) technology and resulted in a cost-effectiveness of \$11,815/ton of SO₂ removed.

The Hess TGP analysis used a 10% interest rate and 10-year equipment life. The NPS re-evaluated the cost of this control to correct identified analysis issues and estimated a cost-effectiveness of \$4,978/ton (see attached spreadsheet). We could not evaluate NDDEQ's costs

calculations because this information was not provided in the SIP. NPS revisions to the cost analysis suggest that a tail gas treatment unit appears to be very cost effective.

ACID GAS DISPOSAL INJECTION WELL

Both NDDEQ and Hess TGP estimated the costs of an acid gas injection (AGI) well, which would eliminate virtually all routine SO₂ emissions from the facility. According to NDDEQ estimates AGI is very cost effective at \$3,248/ton for the acid gas injection well and \$4,443/ton for the injection well along with redundant compressor and plumbing costs. Hess TGP estimated the cost of an acid gas injection well to be \$3,821/ton. Each of these estimates is well below the cost-effectiveness thresholds selected by other states in this round of regional haze planning. Regardless, we re-evaluated Hess TGP's estimates using the current bank prime rate, a 25-year equipment life and an SO₂ reduction of 702 tons/year, which is the average of annual SO₂ emissions in the last four years, as reported in the SIP. Our revisions indicate that AGI may be even more cost-effective at \$2,636/ton SO₂ removed.

We recommend that NDDEQ require cost effective options to reduce SO₂ emissions in the SIP.

3.8.2 NO_x Controls for the Tioga Facility Reciprocating Internal Combustion Engines

The operating hours and emissions for each of the engines are listed in Tables 38, 39, and 40 below. Given the magnitude of emissions produced from the Clark engines (91% of the facility total NO_x), we agree that they should be the focus the NO_x control evaluation under the reasonable progress determination. We also agree that engines C1D and C1F can be excluded from the control technology analysis based on current emissions and existing controls. The rows highlighted in grey are the annual periods selected to represent the maximum and minimum operation years for the engines considered in our re-evaluation of the NO_x emission control costs.

Table 38. Clark Engine Operation (hours)

Year	C1A	C1B	C1C	C1E	C1G	C1D	C1F

Average	75	66	66	84	57

ND evaluated the costs of Low Emissions Combustion (LEC) retrofits for five of the seven RICE. Citing the difficulty in operating SCR on old 2SLB engines and the fact that LEC would achieve similar emission reductions, SCR was not evaluated for the engines. While there are examples of SCR applied to RICE, we agree that in this case, LEC may produce similar results and therefore limited our review to LEC controls. NDDEQ estimated the cost effectiveness of LEC to be \$8,784/ton of NO_x removed. This is within the range of cost effectiveness thresholds selected by other states in this round of haze planning, and the NDDEQ estimates of LEC retrofits seem high relative to other information. For example, EPA developed cost estimates for LEC retrofits on engines to support their analysis of control options under the Cross State Air Pollution Rule (CSAPR)²⁴ and the Ozone Transport Commission developed a report on emission control techniques for the oil and gas industry²⁵.

Based on this information, costs to retrofit the Tioga RICE (C1A-C1C, C1E and C1G) may range from \$500-\$1,400/ton under most operating scenarios (up to \$6,899/ton in the lowest emission year). Results are summarized in Table 41 below. We recommend that LEC is likely cost-effective for the RICE at the Hess Tioga Gas plant. Given the proximity of this source to Theodore Roosevelt NP as well as the oil and gas source sector impacts within the region, we recommend that NDDEQ require this cost-effective option within this round of regional haze planning.

3.9 Little Knife Gas Plant

Little Knife Gas Plant (LKGP) is located 39 km from Theodore Roosevelt NP. The major emissions source onsite is the 2-stage 2-bed Cold Bed Absorption (CBA) sulfur recovery unit (SRU) tail gas incinerator, accounting for at least 85% of the total facility emissions since 2016. The SRU units recover approximately 94% of the sulfur from the acid gas and convert it to elemental sulfur. The remainder of the acid gas is converted from H₂S to SO₂ by the tail gas incinerator.

The control options evaluated by Petro Hunt include (1) acid gas injection, which essentially eliminates all SO₂ emissions and is relatively cost effective and (2) catalyst replacement in the reactors, which the company estimates will remove 39.42 tons/year. However, NDDEQ determined that “Catalyst replacement due to degradation and/or fouling happens on a regular basis and is not considered for reasonable progress controls.”

The company estimated the cost-effectiveness of AGI to be \$13,665.53, but it appears they inappropriately amortized the costs and miscalculated the annual cost effectiveness in \$/ton. NDDEQ corrected these errors and estimated a cost effectiveness of \$1,598/ton of SO₂ removed.

The NPS also recalculated the cost-effectiveness of AGI using the company's estimates of total capital investment to drill the injection well and the annual operating and maintenance costs provided by Petro Hunt. We calculated three scenarios. In the first scenario, we used assumptions that NDDEQ implemented for other sources, including a 5.5% interest rate and a 20-year equipment life. Using these assumptions, we derived a cost-effectiveness estimate that is very close to NDDEQ's at \$1,620/ton (without the redundant piping and compressor). We also evaluated the costs of AGI using the current bank prime rate of 3.25% and a 25-year equipment life (the CCM recommends that in the absence of documentation justifying a source-specific interest rate, the bank prime rate should be used). With these revisions, AGI is even more cost-effective at \$1,415/ton. Finally, we note that it appears Petro Hunt assumed an electricity cost of 87.94 cents per kilowatt-hour²⁶. This is exceptionally high relative to the default values used in the CCM as well as costs reported by the Energy Information Administration (EIA). The attached EIA document reports that industrial customers in North Dakota paid an average of 7.94 cents per kilowatt-hour for electricity in 2019. When the electricity cost is adjusted to reflect EIA estimates, the estimated cost effectiveness drops to \$1,034/ton. (We did not estimate the costs of a redundant compressor and plumbing, however, this only makes a \$450 difference in the cost effectiveness.)

If AGI is installed, all routine SO₂ emissions from the current SRU process will be eliminated. The cost-effectiveness estimate provided by NDDEQ of \$1,600/ton for the AGI well and \$2,050/ton for the AGI well with redundant compressor and piping systems are well below the cost effectiveness thresholds selected by other states. Most states are proposing cost effectiveness thresholds in the \$4,000-\$10,000/ton range. Our revisions to the cost estimates indicate that it may be even more cost-effective than NDDEQ's estimates. Given the proximity of this source to Theodore Roosevelt NP, we recommend that NDDEQ require this cost-effective option to further reduce SO₂ emissions through the draft SIP.

3.10 Northern Border Pipeline Compressor Station No. 4

NDDEQ requested a four-factor analysis from this facility based on its proximity to Theodore Roosevelt NP and recent emissions information. Northern Border Pipeline's (NBPL) Compressor Station No. 4 (CS4) is located 18 km from the Class I park and consists of a 20,000-horsepower simple cycle natural gas-fired Cooper-Rolls Model Coberra 2648S Avon Turbine. The turbine at this facility is currently uncontrolled and has not been upgraded since installation. Therefore, we agree with NDDEQ's conclusion that this facility should complete a four-factor analysis for potential NO_x emission controls. As discussed below, we recommend that SCR is

²⁶ Petro Hunt assumed the electricity costs of operating a 2,400-volt, 500 HP motor, drawing 107 amps that would use 400 KWH would cost \$351.74 / day and \$128,385.00 / year. This works out to 87.93 cents per kilowatt hour.

cost-effective for this facility and request that NDDEQ include this control measure for CS4 in the regional haze SIP.

Based on NDDEQ’s analysis, data from 2012–2018 was used to when determining representative operations for the facility because this seven-year period captured two high utilization years, two low utilization years, and three moderate utilization years. (See Table 42 below.)

Table 42. NBPL Compressor Station No. 4 Yearly Operational Data

Year	Operating Time (hrs)	Yearly Duty (MMBtu/yr)	Utilization
2012	8,494	1,262,480	97%
2013	8,346	1,328,516	95%
2014	4,116	594,188	47%
2015	3,713	499,517	42%
2016	7,161	1,052,922	82%
2017	6,822	1,048,291	78%
2018	6,909	983,570	79%
Average	6,509	967,069	74%

According to the North Dakota SIP “[t]he representative emissions rate (lb/MMBtu) was calculated from an average of 11 tests over the 7 years. These tests are considered representative of typical operations and anticipated future operations. Load during testing ranged from 58% to 95%, with an average of 81%. Emissions rates varied from 0.21 to 0.33 lb/MMBtu, with an average of 0.27 lb/MMBtu.³ The value of 0.27 lb/MMBtu is used as the starting point when determining the cost of compliance for add-on controls evaluated in 3.2.” (See Table 43 below.)

Table 43. NBPL Compressor Station No. 4 Yearly Emissions Data

Year	Representative Emissions Rate (lb/MMBtu)^A	Emissions Rate (lb/hr)	Calculated NO_x Emissions (tpy)
2012	0.27	40.3	171
2013	0.27	43.1	180
2014	0.27	39.1	80
2015	0.27	36.5	68
2016	0.27	39.8	143
2017	0.27	41.6	142
2018	0.27	38.6	133
Average	0.27	39.9	131

^A. Average tested emission rate from testing completed from 2012-2018.

NDDEQ and NBPL analyzed the cost of one add-on control, which was SCR. The applicant considered water injection as a control option, but this was eliminated from consideration by NDDEQ. We agree with this determination given the modest NO_x control performance of water injection relative to SCR. Combustion controls were not considered because the “turbine manufacturer does not offer a burner retrofit option for lean premixed combustion.” NDDEQ’s cost effectiveness estimate of \$13,040/ton of NO_x removed was based on an assumed 80% control-efficiency and a seven-year average of emissions. NBPL’s cost-effectiveness estimate was slightly higher at \$13,280/ton.

We re-evaluated the SCR cost-effectiveness calculations for CS4 that considered a range of operating/emission scenarios. The scenarios presented in our written feedback are as follows:

1. An analysis using the average emissions (2012-2018) utilized by NDDEQ, representing 74% utilization, 90% NO_x control efficiency, a 3.25% interest rate and 25-year equipment life.
2. An analysis using the average emissions (2012-2018) utilized by NDDEQ, representing 74% utilization, 80% NO_x control efficiency, a 3.25% interest rate and 25-year equipment life.
3. An analysis using maximum actual emissions (2013) and 90% NO_x control efficiency, a 3.25% interest rate and 25-year equipment life.
4. An analysis using maximum actual emissions (2013) and 80% NO_x control efficiency, a 3.25% interest rate and 25-year equipment life.
5. An analysis using potential-to-emit (PTE) at 8760 hours and max uncontrolled emission rate of 66.8 lb/hr (from the Title 5 permit) and 90% control (per the July 2021 EPA Clarification Memorandum—see explanation below).
6. An analysis using PTE at 8760 hours and max uncontrolled emission rate of 66.8 lb/hr (from the Title 5 permit) and 80% control (per the July 2021 EPA Clarification Memorandum—see explanation below).

As noted in our November 10, 2021 PowerPoint presentation, we also calculated several other operational scenarios. However, our conclusions provided in this written feedback rely on the results from the six scenarios listed above for several reasons.

First, when considering the seven years of operational data provided in the North Dakota SIP, in five of the seven years, CS4 operated at approximately 80% capacity or greater. It is anticipated that the facility will continue operation at this level in *most* years. The minimum operation scenario may not be representative of the facility’s emissions on average, nor does it capture the potential maximum impact of the facility in Theodore Roosevelt NP. Second, the SIP notes that based on testing data, emission rates ranged from 0.21 up to 0.33 lb/MMBtu, which is at (or slightly above) the source’s permitted limit of 66.8 lb/hr, indicating that at times, the facility operates up to its potential-to-emit.

In Section 4.5 of their July 2021 Clarification Memorandum, EPA addresses how utilization assumptions should be handled in a four-factor cost analysis:

*“However, in some cases states may have projected significantly lower total emissions **due to unenforceable utilization or production assumptions** and those projections are dispositive of the four-factor analysis. For example, a state that rejected new controls solely based **on cost effectiveness values that were higher due to low utilization assumptions**. In this circumstance, an emission limit that requires compliance with only an emission rate may not be able to reasonably ensure that the source’s future emissions will be consistent with the assumptions relied upon for the reasonable progress determination.”*

We recommend that this issue is particularly important for “load-following” sources such as compressor stations, which can have significant year-to-year variation in utilization, as demonstrated in the seven years of operational data for NBPL’s CS4. For this reason, we recommend that operational assumptions used in cost analyses should reflect averages over a recent period as well as maximum *actual* operations, as this does not skew the cost-effectiveness estimates based unenforceable low-utilization assumptions. The PTE scenario reflects an upper bound of emissions given that the facility *may* operate up to this limit. When estimates indicate that the control technology may be cost-effective for each of these scenarios (average actual emissions, maximum actual emissions, and PTE), it is likely that the technology is economically feasible.

Our cost analysis results for each of these scenarios are presented in Table 44 below.

Table 44. NPS SCR Cost-Effectiveness Estimates for Six Operational Scenarios

Control Scenario	NPS Estimated Cost Effectiveness (\$/ton)
7-year Average Emissions (2012-2018) 131 TPY—Approx. 74% Avg. Capacity 90% Control Efficiency	\$3,688
7-year Average Emissions (2012-2018) 131 TPY—Approx. 74% Avg. Capacity 80% Control Efficiency	\$4,120
Max Actual Emissions/Operating Year (2013) 180 TPY—95% Capacity 90% Control Efficiency	\$2,800
Max Actual Emissions/Operating Year (2013) 180 TPY—95% Capacity 80% Control Efficiency	\$3,126
PTE Emissions 293 TPY—100% Capacity 90% Control Efficiency	\$1,844
PTE Emissions 293 TPY—100% Capacity 80% Control Efficiency	\$2,056

Our revisions to the cost estimates indicate that SCR is cost-effective under a range of operating scenarios. Given the proximity of this source to Theodore Roosevelt NP, we recommend that NDDEQ require this cost-effective option to reduce NO_x emissions in the draft SIP.

4 Oil & Gas Area Source Recommendations

4.1 NPS Conclusions/Response

We recommend that North Dakota should address NO_x emissions from both point and upstream oil and gas area sources in this round of regional haze planning. Our recommendations on the three oil and gas point sources selected for four-factor analysis are provided in the preceding sections. This section addresses our recommendations for upstream oil and gas area sources, including the need for basin-wide stationary engine NO_x requirements. We recommend that such measures are and will continue to be necessary to address oil and gas emission impacts in Theodore Roosevelt NP.

Emissions from oil and gas sources in the Williston Basin are significant. Based on the final future year oil and gas inventories developed by the Western Regional Air Partnership (WRAP) Oil and Gas workgroup, the Williston Basin has the highest NO_x emissions of any oil and gas basin within the WRAP region.²⁷ Using NDDEQ's 2028 projections in Table 15 of the SIP (which are slightly lower than the WRAP projections for oil and gas), future year 2028 NO_x emissions from point and area oil and gas sources are nearly double the anticipated 2028 NO_x emissions from North Dakota EGUs. In short, in the future 2028 NO_x emissions from the oil and gas industry will outpace emissions from EGUs, and to some degree, may be offsetting the benefit of reductions from the EGU source sector.

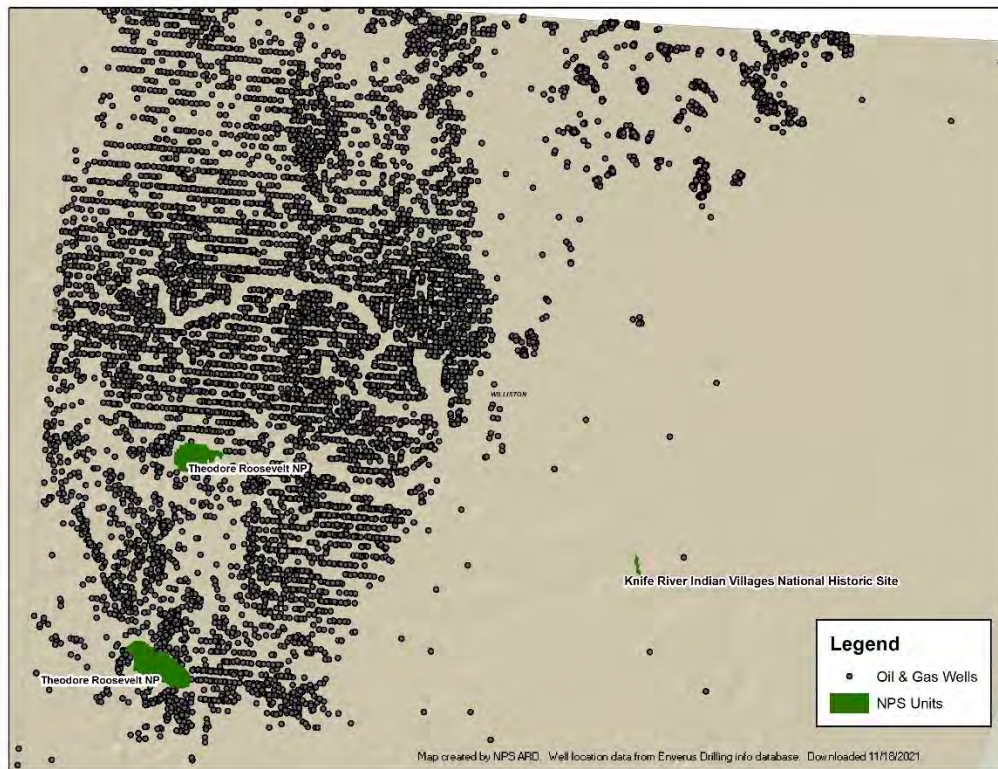

As of November 18, 2021, there were 22,166 active, drilled or permitted wells within the North Dakota portion of the Williston Basin.²⁸ As shown in Figure 21 below, the oil and gas development within the region surrounds Theodore Roosevelt NP.

²⁷ Final WRAP oil and gas inventories include the "Continuation of Historical Trends" projection as well as the Future Year Lower Scenario and Future Year Higher Scenario Spreadsheets. Final reports and spreadsheets for each future year inventory are available on the WRAP website at: <https://www.wrapair2.org/ogwg.aspx>.

Estimates/comparisons drawn do not include the Texas side of the Permian Basin. Emissions from the Texas and New Mexico side of the Permian Basin combined likely rival those in the Williston Basin. Nonetheless, NO_x emissions from upstream oil and gas sources near Theodore Roosevelt NP are substantial.

²⁸ Source: Enverus DrillingInfo database query, 11/18/2021. See <https://www.enverus.com/about-enverus/>.

Figure 21: Active ND Oil and Gas Well Surface Locations Near Theodore Roosevelt NP.

We agree that NO_x emissions are the primary concern from oil and gas operations. However, we disagree with NDDEQ’s conclusion regarding oil and gas SO₂ emissions: *“SO₂ emissions from future oil and gas activities are not a concern because most new oil and gas production is from the Bakken formation which contains sweet oil and gas with very low sulfur content.”*

According to the North Dakota SIP, oil and gas area and point sources currently account for 15,205 tons/year of SO₂ based on 2016-2018 emissions information. This is not trivial and we recommend that NDDEQ require the SO₂ emission reduction measures for the oil and gas point sources addressed in Sections 3.8 and 3.9 of this comment document.

With regard to oil and gas area source NO_x emissions, NDDEQ determined that:

“collectively, emissions from wellsite engines in North Dakota are the largest source of NO_x emission from upstream oil and gas development. Individually, emissions from any one wellsite engine are minor, making any single sites contribution to visibility impairment insignificant. North Dakota oil producers are currently meeting the gas capture goals put in place by the North Dakota Industrial Commission. With increased infrastructure being continually developed in North Dakota, it is reasonable to expect this trend to continue. Finally, North Dakota is currently making progress to improve visibility, and this is expected to continue through this planning period. For these reasons, the Department does not believe it is reasonable to implement additional controls on sources in this sector during this planning period.”

As discussed below, we recommend that NDDEQ require NO_x reduction opportunities in this round of regional haze planning.

4.2 Engine Rules—NO_x Reduction Opportunity

The significant cumulative emissions from the upstream oil and gas source sector combined with the limited emissions footprint from any single wellsite points to the need for source category rules such as statewide engine rules. As noted by NDDEQ in the draft SIP, *“collectively, emissions from wellsite engines in North Dakota are the largest source of NO_x emission from upstream oil and gas development.”* Many states now implement state or region-wide requirements to limit NO_x emissions from area source engines. We encourage ND to consider similar rules and provide several examples here. Below is a summary of the best examples of statewide NO_x limits for NG-fired lean-burn engines:

- 0.5 g/hp-hr
 - TX requires this limit for all engines > 50 HP in their ozone nonattainment areas and a 33-county region.
 - PA requires this limit for all new and existing (permitted between 2013-2018) lean-burn engines > 500 HP
- 0.3 g/hp-hr
 - PA requires this limit for all new lean-burn engines > 2,370 HP
 - NM has permitted large (5,000 HP) engines at this limit
- 0.15 g/hp-hr (approximate conversion – limit is expressed as 11 ppmvd where 1 g/bhp-hr = approximately 73 ppmv for lean burn engines)
 - CA’s South Coast Air Quality Management District and San Joaquin Valley Air Pollution Control District require this for all engines > 50 HP. These were phased-in requirements. It is assumed that post combustion control is necessary to achieve these limits. Furthermore, the SCAQMD prioritizes engine replacement with electric motors.
 - This limit is higher for engines used for gas compression in the SJVAPCD (65 ppmv or 0.89 g/hp-hr).

The options for retrofit or add-on controls that have the most significant emission reduction potential for engines include SCR and Low Emissions Combustion (LEC). The CSAPR TSD Assessment on Non-EGU NO_x Emission Controls²⁹ provides a good discussion of these control technologies and associated costs for lean-burn RICE. For example, with regard to SCR installation on lean-burn engines, the EPA developed linear regression equations for capital and annual costs based on engine HP (2001–2003\$). The EPA relied on information in a 2012 OTC document (Technical Information Oil and Gas Sector Significant Stationary Sources of NO_x

²⁹EPA, Final Technical Support Document (TSD) for the Cross-State Air Pollution Rule for the 2008 Ozone NAAQS Docket ID No. EPA-HQ-OAR-2015-0500; Assessment of Non-EGU NO_x Emission Controls, Cost of Controls, and Time for Compliance Final TSD U.S. Environmental Protection Agency Office of Air and Radiation, August 2016.

Emissions) and a 2003 cost analysis completed by the CA South Coast Air Quality Management District in support of Rule 4702 when developing these linear regressions. NO_x reductions of approximately 90% or greater are achievable. EPA developed similar regression equations to estimate the costs of LEC retrofits.

Below is a summary of the best examples of statewide NO_x limits for NG-fired rich-burn engines:

- 0.20 g/hp-hr with the application of NSCR (a.k.a. 3-way catalyst)
 - PA requires this limit for all rich-burn engines > 500 HP. PA also has a 0.25 g/hp-hr limit for all existing and new rich burn engines > 100 HP and ≤ 500 HP
- 0.16 g/hp-hr
 - This limit is applicable in CA's South Coast Air Quality Management District and San Joaquin Valley Air Pollution Control District (see note below)

Please note, the CA and TX limits described above apply to rich and lean-burn engines alike (for rich burn engines, the 11 ppmvd limit in CA is approximately 0.16 g/hp-hr). It is anticipated that these limits will be achieved with NSCR. Colorado currently requires installation on NSCR on all rich-burn engines and recently approved a proposal that established NO_x limits for rich-burn engines of 0.8 g/hp-hr on existing engines (in service on or before November 14, 2020) and 0.5 g/hp-hr for new engines (in service, modified, or relocated after November 14, 2020).

We recommend that North Dakota consider engine rules similar to those implemented in Pennsylvania, Texas or California to reduce NO_x emissions from engines associated with upstream oil and gas operations.

4.3 NPS Oil and Gas Special Study

Data from an intensive study at Theodore Roosevelt National Park in 2013 and 2014 demonstrated that emissions from oil and gas activities are impacting ambient concentrations of nitrogen oxides, black carbon and VOCs in the region (Prenni et al., Atmospheric Chemistry and Physics, 16, 1401–1416, 2016). Wintertime haze episodes were observed during this same study at the North Unit of Theodore Roosevelt National Park. (Evanoski-Cole et al., Atmospheric Environment, 156, 77-87, 2017). Haze episodes were associated with periods of stagnation and were dominated by emissions from the Bakken region. Formation of ammonium nitrate, the dominant haze component, was most sensitive to nitric acid concentrations during early spring, suggesting capacity for further ammonium nitrate formation if nitrogen oxide emissions increase.

Bakken oil and gas activities have also led to an increase in regional fine soil and elemental carbon concentrations, as well as coarse mass from 2002 to 2015 (Gebhart et al., Journal of the Air & Waste Management Association, 68, 477–493, 2018).

Although oil and gas activities have led to increases in particulate matter, the impact has been at least partially offset by a concurrent reduction in emissions from coal-fired electric generating stations.

This information suggests that oil and gas emission are currently impacting air quality and anthropogenic haze levels in Theodore Roosevelt NP. Based on future year emission inventory projections, it is likely the impacts from oil and gas emissions will continue throughout the planning period. Again, we recommend that NDDEQ address this source sector and require NO_x emission reduction measures for the engine source category.

11/10/2021 - NPS Formal Consultation Call with the North Dakota Department of Environmental Quality on Regional Haze SIP Development. Attendees:

- National Park Service
 - Wendy Ross, Theodore Roosevelt NP, ND
 - Maureen McGee-Ballinger, Theodore Roosevelt NP, ND
 - David Pohlman, Interior Region 3, 4, & 5 – St. Paul, MN
 - Kirsten King, Air Resources Division (ARD) – Denver, CO
 - Debbie Miller, ARD – Denver, CO
 - Melanie Peters, ARD – Denver, CO
 - Don Shepherd, ARD – Denver, CO
 - Andrea Stacy, ARD – Denver, CO
- North Dakota DEQ
 - David Stroh
 - David Glatt (NDDEQ Director),
 - Jim Semerad (Air Quality Director),
 - Rhannon Thorton (RH SIP team)
- Fish & Wildlife Service
 - absent
- U. S. Forest Service
 - Shannon Boehm
 - Jeff Sorkin
 - Jill Webster
 - Trent Wickman
- Environmental Protection Agency (EPA) Region 8
 - Clayton Bean
 - Jaslyn Dobrahner

Agenda

- Welcome & Introductions
- NPS Regional Haze Background
- North Dakota Context
 - NPS Class I Areas affected
 - Emissions
- NPS SIP Feedback for North Dakota
 - Source Selection
 - Four-Factor Analysis Feedback
 - Long Term Strategy
- Next-Steps

We welcome discussion at any time during this presentation. Please feel free to ask questions or add information along the way.

NPS Photo of a bison, Badlands NP

By the Numbers

- 423 national park units
- 237 million park visitors
- \$14.5 billion spent in local gateway regions

Nationally, in 2020 NPS visitation and spending numbers were down due to the pandemic. It is pretty amazing that even in 2020 there were 237 million park visitors who generated \$14.5 billion for the economy – perhaps emphasizing more than ever the economic value of National Parks to our country.

For comparison in 2019:

328 million park visitors spent an estimated \$21 billion in local gateway regions while visiting National Park Service lands across the country.

These expenditures supported a total of

- 341 thousand jobs,
- \$14.1 billion in labor income,
- \$24.3 billion in value added, and
- \$41.7 billion in economic output in the national economy.

<https://www.nps.gov/subjects/socialscience/vse.htm>

By the Numbers

- **48** Class I areas
- In **24** states
- **90%** of visitors surveyed say that scenic views are **extremely** to **very** important
- **100%** of visitors surveyed rate clean air in the **top 5** attributes to protect in national parks

List of Class I areas: <https://www.nps.gov/subjects/air/npsclass1.htm>

States with at least one Class I area:

AK, AZ, CA, CO, FL, HI, ID, KY, ME, MI, MN, MT, NC, ND, NM, OR, SD, TN, TX, UT, VA, VI, WA, WY

Statistics citation:

Kulesza C and Others. 2013. National Park Service visitor values & perceptions of clean air, scenic views, & dark night skies; 1988–2011. Natural Resource Report. NPS/NRSS/ARD/NRR—2013/622. National Park Service. Fort Collins, Colorado

NPS photo of Great Smoky Mountains NP, NC & TN

The NPS has an affirmative legal responsibility to protect clean air in national parks.

- 1916 NPS Organic Act: created the agency with the mandate to conserve the scenery, natural and cultural resources, and other values of parks in a way that will leave them unimpaired for the enjoyment of future generations. This statutory responsibility to leave National Park Service units “unimpaired” requires us to protect all National Park Service units from the harmful effects of air pollution.
- 1970 Clean Air Act: authorized the development of comprehensive federal and state regulations to limit emissions from both stationary (industrial) sources and mobile sources. The Act also requires the Environmental Protection Agency to set air quality standards.
- 1977 Clean Air Act Amendments: these amendments to the Clean Air Act provide a framework for federal land managers such as the National Park Service to have a special role in decisions related to new sources of air pollution, and other pollution control programs to protect visibility, or how well you can see distant views. The Act established a national goal to prevent future and remedy existing visibility impairment in national parks larger than 6,000 acres and national wilderness areas larger than 5,000 acres that were in existence when the amendments were enacted (Class I areas).
- 1990 Clean Air Act Amendments: created regulatory programs to address acid rain and expanded the visibility protection and toxic air pollution programs. The acid rain regulations began a series of regional emissions reductions from electric generating facilities and industrial sources that have substantially reduced air pollutant emissions.

NPS photo of Washington DC: <https://npgallery.nps.gov/AirWebCams/wash>

Visibility goal:

Restore natural conditions by 2064

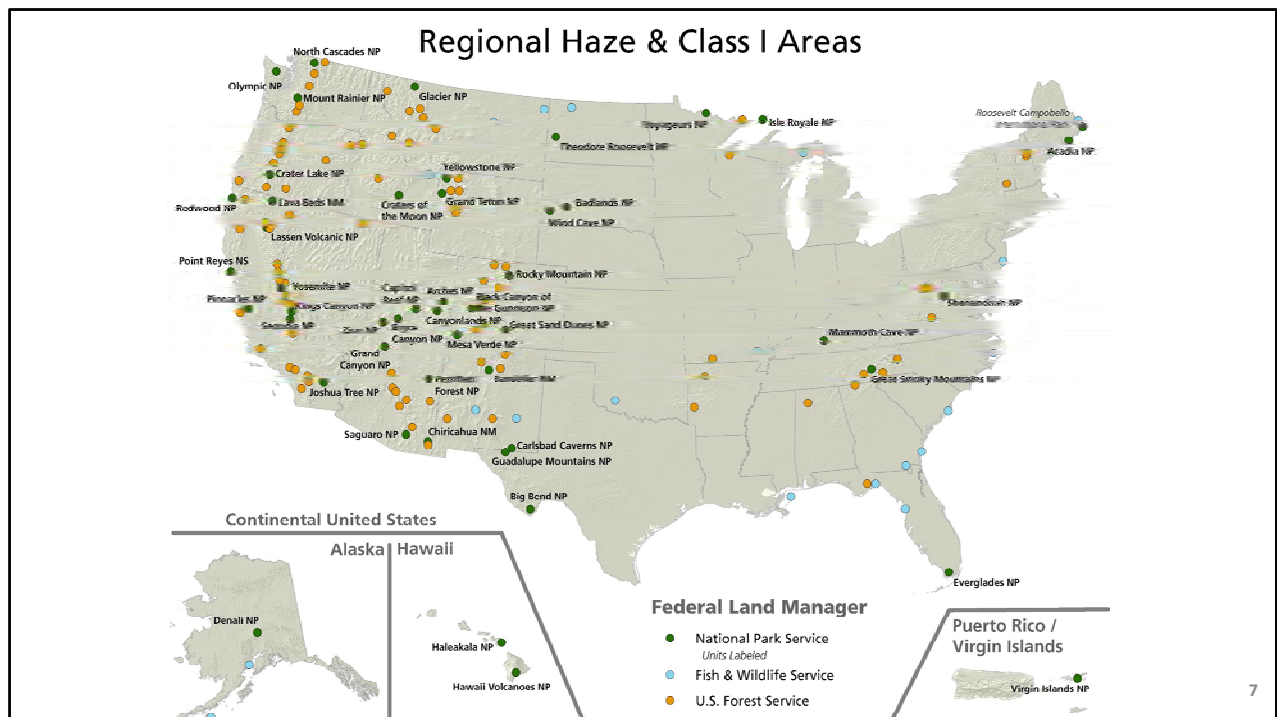

6

Yosemite NP, California and Great Smoky Mountains NP, Tennessee and North Carolina

Left to right images illustrate hazy to clear conditions.

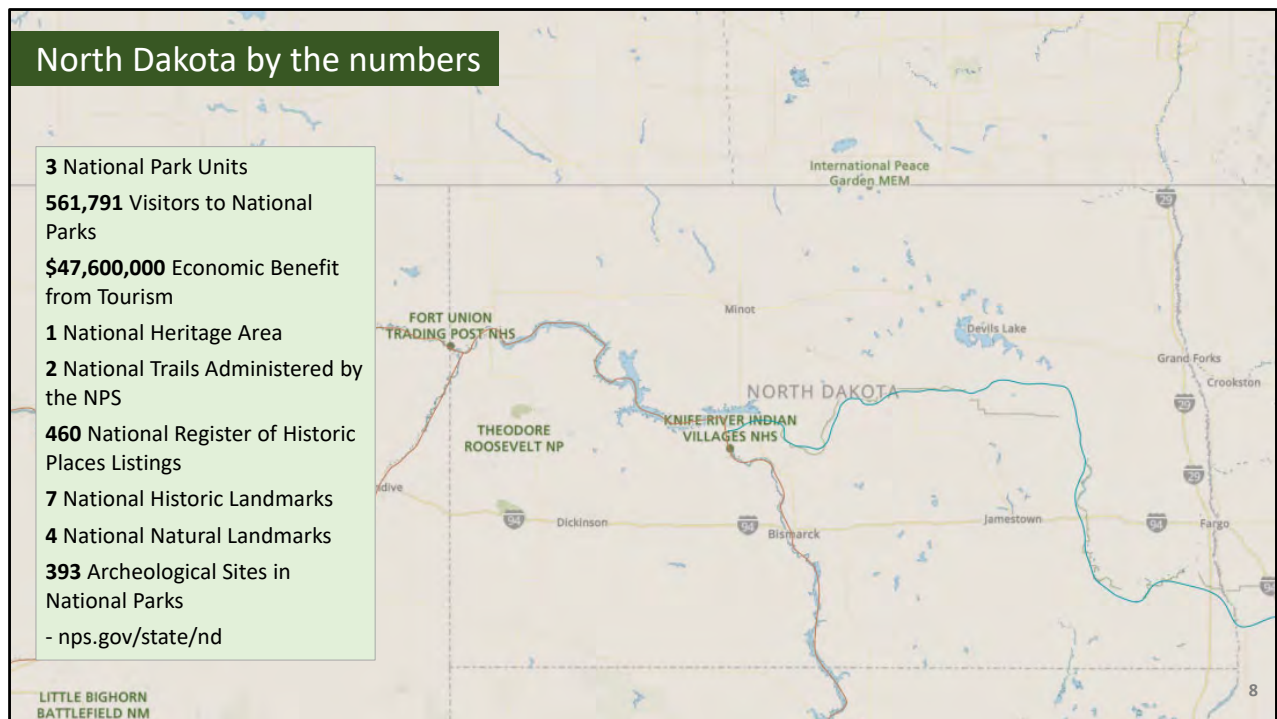

Haze obscures the color and detail in distant features.

NPS photos

As you know, the NPS is one of three Federal Land Managers (FLMs) with responsibility for the 156 Class I areas nationwide. The NPS manages 48 Class I areas. North Dakota is home to one NPS managed Class I area: Theodore Roosevelt NP. In addition, emissions from the state affect visibility at nearby Wind Cave and Badlands National Parks in South Dakota, and Voyageurs National Park, in Minnesota.

NPS Class I Areas

most affected by North Dakota

**BADLANDS
NATIONAL PARK**

**WIND CAVE
NATIONAL PARK**

**THEODORE ROOSEVELT
NATIONAL PARK**

BADLANDS NATIONAL PARK

The rugged beauty of the Badlands draws visitors from around the world. These striking geologic deposits contain one of the world's richest fossil beds. Ancient horses and rhinos once roamed here. The park's 244,000 acres protect an expanse of mixed-grass prairie where bison, bighorn sheep, prairie dogs, and black-footed ferrets live.

Badlands National Park is home to many resilient creatures, including some of the most endangered species in North America. To survive the bitter winters and searing summers of the Great Plains, you need a good plan -- and the wildlife of the park have arrived at many ingenious solutions to the problems of exposure, heat, cold, and drought. Iconic animals as the American Bison, Black-footed Ferret and Rocky Mountain Bighorn Sheep are just a few of these species.

The largest mixed grass prairie in the Region is within Badlands NP.

A prairie is a large, open expanse of grasslands. A mixed-grass prairie is a grassland where grasses of many different heights grow. Mixed-grass prairies are the transition between eastern tall-grass prairies, where more rainfall means that taller grasses can grow, and western short-grass prairies, where the dry environment favors shorter grasses. In mixed-grass prairies, such as the grasslands surrounding Badlands National Park, grasses can range in height from ankle-high to waist-high.

Because they are in this transition zone, mixed-grass prairies have a greater number of plant species than any other type of prairie. There are over 400 plant species in Badlands National Park. Although trees, shrubs, and forbs grow in the Badlands, grasses dominate the landscape. The most common grass in the park is Western Wheatgrass, which grows one to three feet tall and is the state grass of South Dakota!

One interesting fact to note is the existence of the Badlands Wilderness Area composed of the Conata and Sage Creek Units. This vast 64,000 acre area is home to bison, prairie dogs, bighorn sheep and the most endangered land mammal in North America. Furthermore, it was critical to the designation of the Park as a class one airshed. The Park is also in the process of being designated as an International dark sky site. Badlands NP is truly a world class park!

NPS photos of the rugged Badlands Landscape, Rocky Mountain Bighorn lambs, and a Sego Lily.

Wind Cave NP is one of only 48 Clean Air Act designated Class I areas managed by the NPS.

- The park was established in 1903 and is the 7th oldest national park in the NPS.
- The mapped portions of Wind Cave itself include over 157 miles of passages, making it one of the longest caves on the world. Exploration is still ongoing.
- The park is sacred to the Lakota people, who trace their origin and that of the buffalo as emerging from Wind Cave. Many other Native American Tribes also have cultural affiliations with the park.
- The surface area of the park is 34,000 acres in size and consists of a mixed grass prairie and ponderosa pine forest. Wildlife includes a genetically distinct bison herd, elk, prairie dogs, and the endangered black-footed ferret.
- There are over 30 miles of hiking trails at Wind Cave, allowing visitors to experience and view the prairie grasslands and its wildlife. The eastern views are very scenic, including the iconic Buffalo Gap and, on a clear day from the top of Rankin Ridge, you can see the Badlands.
- The park receives around 650,000 recreational visitors per year. 89% of visitors indicate they view wildlife and surface features during their visit and scenic vistas are the most highly rated value for a park visitor. Air quality is vital to maintaining this opportunity.
- Wind Cave has over 30 years of air quality monitoring, dating back to 1979. Currently we operate a NADP, CASTnet, IMPROVE, Purple Air, ozone, and particulate matters stations.
- Air quality is considered a vital resource in all management and planning documents. The park completed its Resource Stewardship Strategy in 2021, which states both long term and short-term goals regarding air quality.
- Short term goals include improving our understanding of resource sensitivity, outreach and education about the importance of air quality, and collaboration with partners and other management agencies to protect our airshed.
- The Park is in the process of receiving the designation of an International Dark Sky Park.
- Long-Term stewardship goals are to maintain the data record through continued in-park monitoring, to work with others to reduce pollutant deposition to below ecosystem critical loads, and to eliminate human-caused visibility impairment by the year 2064.

THEODORE ROOSEVELT NATIONAL PARK

Theodore Roosevelt National Park comprises 70,447 acres of land in three separate units. The park was established in 1947 as Theodore Roosevelt National Memorial Park, to honor the memory of Theodore Roosevelt. The North Unit was added in 1948. In 1978 Congress redesignated the area as Theodore Roosevelt National Park and also established the 29,920-acre Theodore Roosevelt Wilderness within the park's North Unit and South Unit. This national park preserves a landscape—the North Dakota Badlands (also referred to as the Little Missouri River Badlands)—that had a profound effect on Theodore Roosevelt. He sought repose, solitude, and mental rejuvenation, and found all three during his time living at the Elkhorn Ranch, which is now the most historically significant portion of the park.

The North Dakota Badlands landscape is one of striking contrasts. The gently rolling mixed grass prairies of the Northern Great Plains suddenly give way to fantastically broken terrain. The landscape was created when soft soils and sedimentary rocks were broken down by the erosive forces of weather and the Little Missouri River and its tributaries. This rugged landscape of sheer cliffs, grassy plateaus, and colored bluffs of red, gray, tan, and golden hues seems inhospitable at first glance. Yet it is home to a variety of plants and an abundance of Northern Great Plains wildlife, including iconic animals of the West such as bison, elk, and bighorn sheep. All together, the three separate units of the park stretch across more than 45 miles of this landscape. And while the three units are geographically separate, they are all linked by the free-flowing Little Missouri River, the park's most important surface water resource.

NPS Photo of River Bend Overlook, Theodore Roosevelt NP, by Dave Bruner.

Long-term Visibility Trends

13

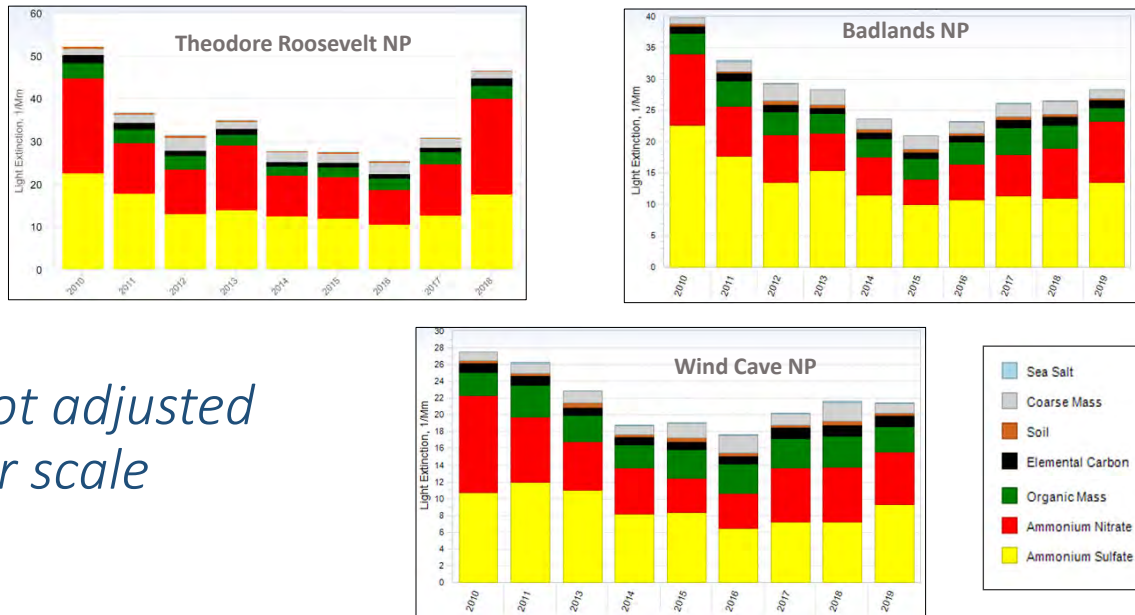

There is a long history of visibility monitoring in our regional Class I areas.

- Theodore Roosevelt National Park has been monitoring visibility since 2000, the monitor for Badlands National Park began operation in 1990 while the monitor at Wind Cave National Park dates back to 2000. NPS staff support the operation of the IMPROVE monitoring network nationally and for many individual monitoring sites. This is how we keep track of the visibility conditions in our Class I areas and monitor progress.
- Graphs shown here highlight the annual average light extinction on most impaired days and on clearest days compared to the target condition (endpoint) for most impaired days and estimated natural conditions on clearest days. These charts show long term improvement and recent increases in haze on most impaired days.

Long term visibility trend graphs generated from:

<http://views.cira.colostate.edu/fed/Express/AqrvTools.aspx>

Haze Composition on Most Impaired Days (2010-2019)

*Not adjusted
for scale*

14

These annual extinction bar graphs show total haze composition over the past 10 years at Theodore Roosevelt, Badlands, and Wind Cave National Parks. These Class I areas have not seen dramatic improvements in light extinction on most impaired days over the past 10 years. In fact, the past few years in all three parks have seen increasing levels of haze. This may not be a statistically significant trend yet, but it is certainly something that we are keeping an eye on. Ammonium sulfate and ammonium nitrate are mostly responsible for recent increases in haze.

Most-impaired days annual light extinction composition stacked bar graphs from:

<http://vista.cira.colostate.edu/Improve/aqrv-summaries/>

Haze Causing Emissions

North Dakota

- Has the **biggest influence** on haze in NPS Class I areas **of any state**.
 - Based on a cumulative Q/d analysis using recent emissions inventory data.
- Among all states, North Dakota EGU emissions are:
 - **Top 10** for SO₂ (34,383 tpy) and
 - **Top 5** for NO_x (29,897 tpy)
- Emissions from **oil and gas** sources in the ND portion of the Williston Basin are the highest in the WRAP region.

2017 NEI and 2019 CAMD inventory data were used to assess the NO_x + SO₂ (Q) divided by distance (d) visibility impact surrogate for all point sources to each NPS managed Class I area in the country. The top 80% contributing to each Class I area were initially recommended by NPS for evaluation as part of reasonable progress. As part of a prioritization exercise, we summed the Q/d metric for each facility with respect to NPS Class I areas and tallied by state. Based on this, North Dakota ranks number one with respect to cumulative Q/d.

EGU emissions rankings are from the CAMD database and oil and gas emissions data are from the WRAP oil and gas workgroup products.

NPS Photo of Elk, Theodore Roosevelt NP

North Dakota by the numbers

- The oil and gas source sector is a significant source of both NO_x and SO₂ emissions in North Dakota.
- Oil and gas emissions are impacting visibility in Theodore Roosevelt NP.
- Future year 2028 NO_x emissions from point and area oil and gas sources are nearly double future year EGU NO_x emissions.
- While EGU SO₂ emissions are projected to decrease, SO₂ emissions from oil and gas area sources are projected to increase.

Haze Causing Emissions

WRAP Oil and Gas Workgroup Future Year Emissions—Low Scenario

North Dakota Draft SIP Feedback

Source Selection

North Dakota selected all nine NPS-recommended sources for four-factor analysis plus Northern Border

1. Coyote
2. Antelope Valley
3. Coal Creek
4. Milton R Young
5. Leland Olds
6. R M Heskett
7. Great Plains Synfuels Plant
8. Tioga Gas Plant
9. Little Knife Gas Plant
10. Northern Border

❖ Oil & Gas Area Sources

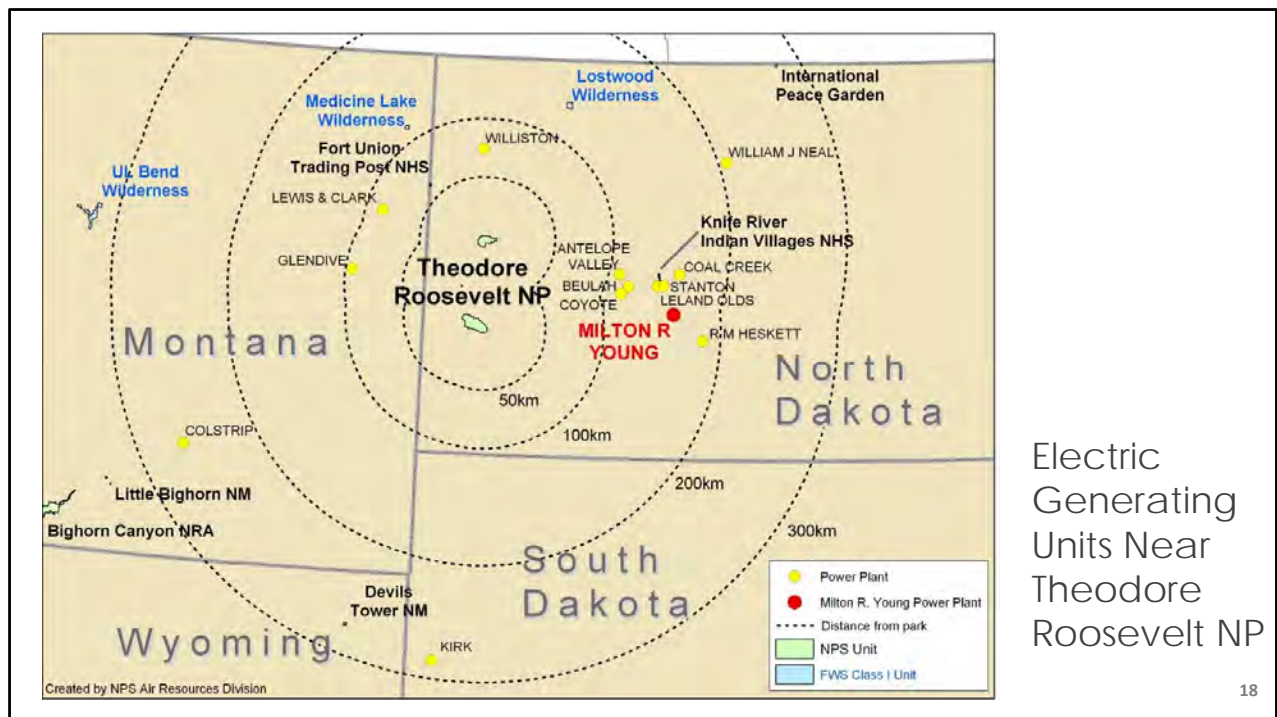

We appreciate that ND selected all of the NPS recommended point sources.

We also recommended that ND consider opportunities to address haze causing emissions Oil and Gas area sources when we met as part of early engagement.

We have reviewed each of the four factor analyses and will spend the next portion of this presentation providing our feedback and recommendations on these and asking questions where they remain.

*Note, we have slightly re-arranged this list from the order in the draft SIP to group the source sectors. Highlighting indicates the division of review among NPS staff who will be presenting today.

NPS Photo of Blanket flower, Wind Cave NP

NPS Map – Note, this map was created for a previous review focused on Milton R Young. For this purpose, we present the map to highlight the proximity of EGUs to Theodore Roosevelt NP and not to single that facility out specifically.

Cost of Control

- *Overarching EGU Feedback*

- The 4FAs provided are the best we have seen. However, they suffer from some common errors:
 - Contingency Cost multiplier of 20% is too high—CCM recommends 10%
 - Inclusion of Owners Costs
 - Interest Rates is too high without justification—CCM recommends current prime (3.25%)
 - Remaining Useful Life is too short—CCM recommends 20 years for SNCR and 30-years for scrubbers and SCR unless limited by a federally-enforceable condition.
 - Inclusion of Property Taxes

Technical Feasibility

- *SCR on North Dakota lignite*

- SCR is available.
- SCR is applicable because it is in use on coal-fired EGUs, including lignite-fired EGUs (in Texas)
- The critical issue is SCR deactivation due to catalyst poisoning. Catalyst deactivation is an economic issue.
- We agree with ND that TE-SCR is technically-feasible on tangentially-fired and wall-fired boilers burning ND lignite. Has SCR been tested in a tail-end configuration on a ND lignite-fired cyclone boiler?

Coyote Station

- *Electric Generating Unit*

- Of 3,317 EGUs in CAMD in 2020, Coyote ranked #5 for SO₂ and #4 for NO_x.
- All of the SO₂ control options, including replacement of the existing scrubbers, are reasonable on an average \$/ton basis. The incremental cost of a new WFGD may be prohibitive.
- Replacement of the existing dry scrubber could reduce SO₂ emissions by almost 11,600 tpy versus baseline emissions.
- All of the NO_x control options evaluated are reasonable.
- Addition of RRI to Optimized SNCR could reduce NO_x emissions by almost 4,000 tpy versus baseline emissions.
- Addition of SCR could reduce NO_x emissions by almost 5,700 tpy versus baseline emissions.

Antelope Valley Station

- Electric Generating Unit

- Of 1,167 facilities in CAMD in 2020, AVS ranked #15 for SO₂ and #64 for NO_x.
- All of the SO₂ control options, including replacement of the existing scrubbers, are reasonable.
- Replacement of the existing dry scrubbers with modern new scrubbers could cost-effectively reduce facility SO₂ emissions by over 10,000 ton/yr.
- Addition of SNCR would cost less than \$7,000/ton.
- Addition of SCR would have an average cost less than \$9,000/ton with incremental cost (versus SNCR) of less than \$10,000/ton.
- Addition of SNCR could reduce facility NO_x emissions by 700 ton/yr while addition of SCR could reduce facility NO_x emissions by over 2,300 ton/yr.

22

Coal Creek Station

- *Electric Generating Unit*

- *Note – Still Under Review

Milton R. Young Station

- Electric Generating Unit

- Of 1,179 facilities in CAMD in 2019, MRYS ranked #93 for SO₂ and #12 for NO_x
- We evaluated addition of TE-SCR to Units 1 & 2 and found it cost-effective and reduces plant NO_x emissions by over 6,800 tpy.
- The scrubber on Unit 1 is 96.5% efficient. The scrubber modifications evaluated appear to be cost-effective.
- The scrubber on Unit 2 is 93.3% efficient and recent emission rates have been increasing. Improved scrubber efficiency should be evaluated.
- *Note – *Still Under Review*

24

Leland Olds Station (1 of 2)

- *Electric Generating Unit*

- Of 1,167 facilities in CAMD in 2020, LOS ranked #105 for SO₂ and #48 for NO_x.
- January 2021 Hg emissions were: Unit 1= 1.01 lb/Trillion Btu (TBtu), Unit 2 = 5.02 lb/TBtu.
- Unit 1 SO₂ emission rates have been increasing.
- All of the NO_x control options evaluated are reasonable.
- The existing SNCR on Unit 2 is only about 4% effective. Adding RRI to SNCR could reduce NO_x emissions by almost 1,200 tpy
- We evaluated addition of TE-SCR to Unit 2 and found it cost-effective. This strategy could reduce NO_x emissions by over 3,500 tpy compared to existing controls.

Leland Olds Station (2 of 2)

- *Electric Generating Unit*

- We evaluated addition of TE-SCR to Unit 2 and found it cost-effective
- The annual average cost effectiveness of adding RRI to SNCR at LOS Unit 2 would be acceptable in the context of the thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by almost 1,200 tpy.
- The annual average cost effectiveness of adding SCR at LOS Unit 2 would be acceptable in the context of the thresholds used by AR, TX, CO, NM, and OR. This strategy could reduce NO_x emissions by over 3,500 tpy compared to existing controls.

North Dakota Draft SIP Feedback

R. M. Heskett

- *Electric Generating Unit*

- It is our understanding that the plant will cease burning coal in 2022 and install an 88 MW natural gas-fired simple-cycle combustion turbine.
- The permitted sum of future annual SO₂ (12 tpy) and NO_x (315 tpy) divided by the distance 185 km) to THRO is 1.8.
- We agree that no 4FA is needed.

Great Plains Synfuels Plant

- *Coal Gasification & Fertilizer Facility*

- Emissions units include three 763 MMBtu/hr Riley boilers and two 169 MMBtu/hr superheaters with common stack
 - Boilers burn waste gas, stink gas, tar oil, naphtha/phenol (N/P) blend, lock gas, medium BTU purge gas, and SNG
- Baseline emissions of 3,003 tons SO₂/year and 2,454 tons NO_x/year; q/d=61
- Analysis of tail-end SCR suggests potential for catalyst poisoning
 - Are concentrations of alkalis/other contaminants known?
- SCR analysis uses 5.5% interest rate (vs. bank prime) and 20-year life
- Analysis lacks details on major costs such as equipment and labor
- SIP suggests facility may discontinue gasification process

28

Hess Tioga Gas Plant (1 of 2)

- *Natural Gas Processing Facility*

- The Hess Tioga Gas Plant is located approx. 91 km from Theodore Roosevelt NP.
- ND evaluated the costs of LEC for 5 of the 7 RICE. (SCR was not evaluated for the RICEs).
 - ND estimated the cost effectiveness of LEC to be \$8,784
 - ND estimates seem high relative to other information (i.e., EPA cost estimates to support analysis of control options under the CSAPR and Ozone Transport Commission Information on control techniques for the oil and gas industry).
 - Based on this information, costs to retrofit the Tioga RICE may range from \$500-\$1,400/ton (up to \$6,899/ton in the lowest emission year).
- For the sulfur recovery unit tail gas incinerator, ND evaluated the costs of tail gas treatment (SCOT process) and Acid Gas Injection (AGI).

29

Hess Tioga Gas Plant (2 of 2)

- *Natural Gas Processing Facility*

- Although it was found to be technically feasible, ND did not evaluate the costs of tail gas FGD.
 - A cost analysis should be completed for all technically feasible options to determine cost effectiveness relative to other technologies
- According to ND estimates AGI is very cost effective at \$3,248/ton and \$4,443/ton.
 - We recommend ND implement cost effective options to reduce SO₂ emissions
- ND and the company estimated tail gas treatment cost effectiveness at approximately \$11,000/ton
 - The Hess analysis used a 10% interest rate and 10-yr equipment life
 - The NPS re-evaluated the cost of this control to correct identified analysis issues and estimated a cost-effectiveness of \$4,978/ton, which is very cost effective.

30

Petro-Hunt Little Knife Gas Plant (1 of 2)

- Natural Gas Processing Facility

- Little Knife Gas Plant (LKGP) is located 39 km from Theodore Roosevelt National Park, the closest Class I area.
- The major emissions source onsite is sulfur recovery unit (SRU) tail gas incinerator. NO_x emissions from the source are minimal.
- Acid gas injection (AGI) was the only technically feasible option considered and would eliminate all SO₂ emissions from the source.
- Both LKGP and ND evaluated the costs of drilling an AGI well. ND's cost effectiveness estimates were considerably lower than LKGP's; likely due to errors in LKGP cost analysis.
- NPS re-analyzed LKGP's estimates and derived cost effectiveness estimates that are comparable with North Dakota's.

North Dakota Draft SIP Feedback

Petro-Hunt Little Knife Gas Plant (2 of 2)

- *Natural Gas Processing Facility*

- North Dakota's estimates for AGI are very cost-effective
- We recommend North Dakota implement these cost-effective controls

Control Technology	Emissions (tons/year)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)
Existing SRU (baseline)	307			
Acid Gas Injection	0	307	490,009	1,598
Acid Gas Injection ^A	0	307	628,523	2,050

Northern Border Pipeline Company

- *Compressor Station No. 4*

- NBPL is located 18 km from Theodore Roosevelt National Park
- The 20,000 HP turbine is not equipped with recent NO_x controls.
- The 4FA found SCR and Water injection to be the only feasible controls for the turbine.
- ND estimated a cost effectiveness of \$13,040/ton. NBPL estimated a cost-effectiveness of \$14,435/ton. Can you please clarify the differences between the ND and NBPL cost analyses?
- NBPL assumed a 10-year equipment life, 7% interest and 80% control efficiency.

North Dakota Draft SIP Feedback

Northern Border Pipeline Company

- Compressor Station No. 4

- We re-evaluated the costs of SCR using the bank prime rate and a longer equipment life under various operational and capacity scenarios.
- Although the costs vary among scenarios, generally, we found SCR to be cost effective even with reduced capacity.

Control Scenario	NPS Estimated Cost Effectiveness
Max Throughput Year—2012 at 97% Capacity 90% control efficiency 0.325 lb/MMBtu uncontrolled emission rate	\$2,051
Max Throughput Year—2012 at 97% Capacity 80% control efficiency 0.325 lb/MMBtu uncontrolled emission rate	\$2,288
Max Throughput Year—2012 at 97% Capacity 90% control efficiency 0.27 lb/MMBtu uncontrolled emission rate	\$3,136
Max Throughput Year—2012 at 97% Capacity 80% control efficiency 0.27 lb/MMBtu uncontrolled emission rate	\$3,505
Min Throughput Year—2015 at 42% Capacity 90% control efficiency 0.325 lb/MMBtu uncontrolled emission rate	\$4,189
Min Throughput Year—2015 at 42% Capacity 80% control efficiency 0.325 lb/MMBtu uncontrolled emission rate	\$4,683

34

Oil & Gas Area Source

- SIP Conclusions for Oil and Gas Area Sources:

- Collectively, emissions from wellsite engines in North Dakota are the largest source of NO_x emission from upstream oil and gas development.
- However, ND determined individual engine controls are not reasonable during this planning period given:
 - The limited emissions footprint from any single wellsite and;
 - Relatively small contribution to visibility impairment from this sector.

Oil & Gas Area Source

- NPS Response to SIP Conclusions for Oil and Gas Area Sources:

- Significant cumulative emissions coupled with a limited footprint from any single wellsite points to the need for statewide rules that target the oil and gas source sector.
- Many states now implement state or region-wide requirements to limit NOx emissions from area source engines. We encourage ND to consider similar rules.
- NPS study points to visibility impairment from the oil and gas source sector.

North Dakota Draft SIP Feedback

Oil & Gas Area Source

-Examples of Engine Rules from Other States:

Pennsylvania Requirements <u>Existing</u> * Engines		
Engine Type	Rated bhp	NOx Limit
Lean-burn	≤100	2.0 g/bhp-hr
	>100 to ≤500	1.0 g/bhp-hr
	>500	0.50 g/bhp-hr
	>1,000	0.50 g/bhp-hr
Rich-burn	>100 to ≤500	0.25 g/bhp-h
	>500	0.20 g/bhp-h
	>1,000	0.20 g/bhp-h

*Applies to any source permitted under GP-5 on or after Feb 2, 2013 but prior to Aug 8, 2018

- Texas requires engines to meet a 0.5 g/hp-hr limit for all engines > 50 HP in their ozone nonattainment areas and a 33-county region.
- CA's South Coast Air Quality Management District and San Joaquin Valley Air Pollution Control District require all engines > 50 HP to meet a 0.15 g/hp-hr NOx limit (approximate conversion – limit is express as 11 ppmvd where 1 g/bhp-hr = 73 ppmv for lean burn engines)

Oil & Gas Area Source

- *Theodore Roosevelt Special Study (1 of 3)*

- Data from an intensive study at Theodore Roosevelt NP in 2013 and 2014 demonstrated that emissions from oil and gas activities are impacting ambient concentrations of nitrogen oxides, black carbon, and VOCs in the region

(Prenni et al., Atmospheric Chemistry and Physics, 16, 1401–1416, 2016)

NPS photo, Theodore Roosevelt NP

Oil & Gas Area Source

- *Theodore Roosevelt Special Study (2 of 3)*

- Wintertime haze episodes were observed during this same study at the North Unit of Theodore Roosevelt NP.

(Evanoski-Cole et al., Atmospheric Environment, 156, 77-87, 2017)

- Haze episodes were associated with periods of stagnation and were dominated by emissions from the Bakken region.
- Formation of ammonium nitrate, the dominant component, was most sensitive to nitric acid concentrations during early spring, suggesting capacity for further ammonium nitrate formation if nitrogen oxide emissions increase.

NPS Photo, Theodore Roosevelt NP

Oil & Gas Area Source

- *Theodore Roosevelt Special Study (3 of 3)*

- Bakken oil and gas activities have also led to an increase in regional fine soil and elemental carbon concentrations, as well as coarse mass from 2002 to 2015

(Gebhart et al., Journal of the Air & Waste Management Association, 68, 477–493, 2018)

- Although oil and gas activities have led to increases in particulate matter, the impact has been at least partially offset by a concurrent reduction in emissions from coal-fired electric generating stations.

40

NPS Photo, Theodore Roosevelt NP

Long Term Strategy

- *Correlation of Visitation and Most Impaired Days*

- SIP states that focusing on the most impaired days for Theodore Roosevelt NP will not “meaningfully improve visibility or a visitor’s experience” because these days occur primarily during months with lower visitation.
 - Clean Air Act set national goal of “prevention of any future, and the remedying of any existing, impairment of visibility in mandatory Class I federal areas which impairment results from man-made air pollution”.
 - RHR requires that the long-term strategy and RPG must provide for improvement in visibility for the most impaired days
 - NPS is required to conserve resources “in a manner and by such means as will leave them unimpaired” for future generations (16 U.S.C. §1)
 - Protecting visibility is no less important on days with lower visitation

41

Long Term Strategy

- Cost Effectiveness Thresholds (1 of 2)

- ND has not shared a cost effectiveness threshold for this planning period.
- In the first planning period, NDDEQ set BART cost-effectiveness thresholds at \$4,100/ton average and \$7,300/ton incremental based upon 2011\$.
- We adjusted those thresholds to \$4,200/ton average and \$7,500/ton incremental based upon based upon the 2019 CEPCI.
- We are seeing several states with higher thresholds for average cost-effectiveness:
 - AZ @ \$4,000 - \$6,500/ton
 - TX @ \$5,000/ton
 - AR @ \$5,000/ton for EGUs
 - WA @ 6,250/ton for NOX on industrial boilers
 - NM @ \$7,000/ton
 - CO & OR @ 10,000/ton

42

Long Term Strategy

- *Cost Effectiveness Thresholds (2 of 2)*

- EPA has expressed caution regarding using BART costs for Reasonable Progress:

Given the differences between the BART factors and RP factors and the nature of the applicability criteria that would trigger BART and RP analyses, we do not necessarily consider the cost-effectiveness and visibility benefit values from BART determinations to be directly comparable to RP analyses

- It is generally accepted that the cost-effectiveness threshold for Reasonable Progress will be higher as smaller emission units are considered.

ENVIRONMENTAL PROTECTION AGENCY, 40 CFR Part 52, [EPA-R09-OAR-2013-0588; FRL-9912-97- OAR], Promulgation of Air Quality Implementation Plans; Arizona; Regional Haze and Interstate Visibility Transport Federal Implementation Plan, ACTION: Final rule. September 3, 2014

North Dakota Draft SIP Feedback

Long Term Strategy

- *Visibility benefit and URP*

SIP suggests that additional measures not needed because trends in haze on most impaired days are going down

- Overall trends beginning in 2000 are down, but haze increased on most impaired days 2016-2018; continuous improvement will be needed to meet the 2064 goals
- SIP 2064 projection uses adjusted endpoint; this endpoint may change in the future

Note, we intend to elaborate on these concepts in our follow up documentation.

In addition to the points above, it is not appropriate to look at visibility benefits of emission reductions in comparison with 2028 “dirty” background. Many small incremental improvements will be needed in this and subsequent planning periods in order to reach the goal of no human caused impairment by 2064. This “clean” condition is the one against which potential improvements are more appropriately considered.

NPS Photo, Wind Cave NP

Long Term Strategy

- *Visibility benefit and URP*

SIP indicates THRO progress on most impaired days is below adjusted uniform rate of progress

- The glideslope is a planning tool.
- RHR expects states to make continuous progress based upon the four-factor analysis. EPA has made it clear that being under the glideslope is not a reason to dismiss otherwise reasonable controls.
- The goal of the RHR is natural conditions, and no Class I area in the state or downstream has reached that goal yet.

45

Note, we intend to elaborate on these concepts in our follow up documentation.

In addition to the points above, it is not appropriate to look at visibility benefits of emission reductions in comparison with 2028 “dirty” background. Many small incremental improvements will be needed in this and subsequent planning periods in order to reach the goal of no human caused impairment by 2064. This “clean” condition is the one against which potential improvements are more appropriately considered.

Long Term Strategy

- *Visibility benefit and URP*

- Perceptibility, or visibility benefit, is not a requirement for reasonable progress. EPA's 2019 guidance (§II.B.4.g) explicitly states that modeled benefits must be compared to a clean background (e.g., 2064) rather than a dirty background (e.g., 2028) in order to appropriately gauge the potential visibility benefit to overall progress.
- The cumulative benefit of emission reductions over time will be necessary to achieve the Clean Air Act and Regional Haze Rule goal to "prevent future and remedy existing visibility impairment" in Class I areas.

Next Steps

- Thank you for meeting with us!
- Please share:
 - Anticipated SIP schedule

For any formal notifications of public documents, please include the above list of NPS staff.

The NPS values clean air and clear views and recognizes these as essential to our visitor experience and the very purpose of our Class I areas. We recognize opportunities for significant progress to be made in this planning period as we strive toward the goal of unimpaired visibility. We welcome future opportunities to engage with North Dakota and work together on efforts to reduce haze causing pollution and address regional haze in our national parks.

D.2.b – U.S. Forrester Service Comments

File Code: 2580
Date: November 16, 2021

L. David Glatt, P.E.
Director, North Dakota Department of Environmental Quality
4201 Normandy Street
Bismarck, ND 58503-1324

Dear Mr. Glatt:

On September 20th, 2021, the State of North Dakota submitted a draft Regional Haze State Implementation Plan describing your proposal to continue improving air quality by reducing regional haze impacts at mandatory Class I areas across the region. We appreciate the opportunity to work closely with your State through the initial evaluation, development, and subsequent review of this plan. Cooperative efforts such as these ensure that, together, we will continue to make progress toward the Clean Air Act's goal of natural visibility conditions at our Class I areas.

This letter acknowledges that the U.S. Department of Agriculture, U.S. Forest Service, has received and conducted a substantive review of your proposed Regional Haze State Implementation Plan. This review satisfies your requirements under the federal regulations 40 C.F.R. § 51.308(i)(2). Please note, however, that only the U.S. Environmental Protection Agency (EPA) can make a final determination about the document's completeness, and therefore, only the EPA has the authority to approve the document.

We have attached comments to this letter based on our review. We look forward to your response required by 40 C.F.R. § 51.308(i)(3). For further information, please contact Jill Webster at jill.webster@usda or (406) 361-5380.

Again, we appreciate the opportunity to work closely with the State of North Dakota. The Forest Service compliments you on your hard work and dedication to significant improvement in our nation's air quality values and visibility.

Sincerely,

LEANNE M. MARTEN
Regional Forester

North Dakota DRAFT Regional Haze State Implementation Plan (SIP)

Technical Comments

The USFS recognizes and applauds the significant emission reductions made in North Dakota since the early 2000's. Further, we appreciate the strong working relationship among our respective staff and the routine communications during the development of this draft Regional Haze plan.

Overall, the USFS finds that the draft SIP is well organized and comprehensive. We specifically appreciate the thorough and technically sound 'four factor analyses' included in the draft SIP.

The USFS requests that the North Dakota Department of Environmental Quality consider the following before final adoption of the SIP.

Relevance of the Visibility Impact of Individual Sources

Although EPA's 2019 Regional Haze Guidance allows for the consideration of visibility in determining whether emissions control measures are necessary for making reasonable progress, the guidance also states that "because regional haze results from a multitude of sources over a broad geographic area, a measure may be necessary for reasonable progress even if that measure in isolation does not result in perceptible visibility improvement". Widespread emissions controls, particularly for SO₂ and NO_x, are essential for making reasonable progress at Class I areas both near to, and more distant from, emissions sources. Further, small visibility improvements, even those that may be imperceptible by themselves, are essential for making progress towards the National Goal of restoring natural conditions at Class I areas by 2064. EPA further emphasized this requirement of the rule in its memo dated July 8th, 2021.

It appears that North Dakota is *not* considering cost effective controls at several facilities based solely on the argument that source contributions do not significantly impact overall visibility improvements and are therefore, not reasonable. Cost effective controls should be considered regardless of the source's individual, or combined, impact to visibility.

Visibility Impacts During Peak/Off Peak Visitation

While the most anthropogenically impaired days a Class I area, could indeed correspond to periods of the least visitation (as illustrated with Figure 13 in the draft SIP), this does not mean that there is no impairment during periods of high visitation. Any period of visibility impairment should be considered.

Cost Effective Controls Identified, But Not Considered

Again, we applaud North Dakota's comprehensive evaluation of its 'four factor sources'. North Dakota does not define a cost-effective value, in dollars per ton of emission reductions. However, it does identify controls for several sources, at a cost per ton, that has been deemed cost effective by other states and EPA. We ask that the State reconsider requiring some of these

emissions reducing controls, particularly those at the lower end of the cost range. Specifically, reconsider controls identified for sulfur and nitrogen oxides at Coyote, and those improving existing sulfur controls at Antelope Valley units 1 and 2. It is worth noting that similar plants in the State currently perform at less than 0.15 pounds of SO₂ per million BTU. In addition, the State previously determined that enhanced NO_x controls at Coal Creek could feasibly achieve 0.15 pounds of NO_x per million BTU; we see no reason why these controls should not be included in this SIP.

Contribution of North Dakota Emissions to Neighboring State Class I Areas

The draft SIP, sec 2.1.4, states that ‘South Dakota did not identify any sources or areas of concern regarding visibility impacts from North Dakota.’ However, per the draft South Dakota SIP, several North Dakota facilities appear to be ranked as ‘contributing sources’ to visibility at several South Dakota Class I areas. Please consult with the South Dakota Department of Agriculture and Natural Resources regarding these sources and their impact on South Dakota Class I areas. (See Tables 3-1 to 3-3, Tables 3-8 to 3-11, page 84, Figure 3-16, and Tables 3-12 to 3-15 in the South Dakota draft Regional Haze SIP)

Prescribed Fire Emissions

Fire plays an important role in shaping the vegetation and landscape in North Dakota and surrounding states. Recurring fire has been a part of the landscape for thousands of years. Aggressive fire suppression, coupled with an array of other disturbances has changed the historic composition and structure of the forests. Periodic prescribed burning and other vegetation management can recreate the ecological role of fire in a controlled manner. Fire and fuels management supports a variety of desired conditions and objectives across the forests and grasslands (e.g., community protection, hazardous fuels reduction, native ecosystems restoration, historic fire regimes restoration, wildlife openings, and open woodland creation, etc.). The USFS along with our partners, including the North Dakota Forest Service (NDFS), plan to increase the use of prescribed fire to accomplish these goals.

The 2017 Regional Haze Rule includes a provision to allow states to adjust the glidepath to account for prescribed fire. The draft SIP states that prescribed fire emissions were taken from the 2014v2 National Emissions Inventory (NEI) and were carried forward into the 2028 future year emissions. Recent data on prescribed fire activity, especially within the USFS, show that the number of acres burned have increased since the development of the 2014v2 emissions inventory and are projected to increase through the planning period. Therefore, keeping prescribed fire emissions steady to 2028 undercounts these emissions. Nevertheless, the USFS is requesting that North Dakota adjust the glidepaths for prescribed fire projections as a clear acknowledgement of the shared state and federal goals of restoring fire adapted ecosystems. The Future Fire Scenario (FFS2) modeling provided by the Western Regional Air Partnership provides an updated and more accurate assessment of prescribed burning in North Dakota and surrounding states.

Hi David,

I'm making my way through the North Dakota Regional Haze SIP. Congrats on reaching this milestone!

We, the Forest Service, have been reaching out to states regarding the FFS2 modeling that was completed by Ramboll. As you may be aware, this modeling incorporated more accurate Rx burning estimates for Regional Haze planning. However, the modeling was completed later and the data was uploaded to the TSS in April, which I understand, was a bit late in the planning process. Bret Anderson and Scott Copeland have been working with those projections in order to glean out the increased Rx projection and the corresponding endpoint adjustment. This is meant to provide states with an easy way to adjust their 2064 endpoints, even at this late stage in the process, to reflect a more accurate assessment of Rx in the future.

I'm attaching the data for you to consider using in ND's SIP. Since ND is adjusting it's 2064 endpoint to reflect Rx burning, you may consider using these estimates.

Please let me know if you have any questions and would like to discuss!

Talk Soon,
Jill

Future fire sensitivities added wildfire emissions (FFS1) or wildland prescribed fire emissions (FFS2) as two potential future variations in fire activity that are not specific to any single future year. The fire sensitivities are added to the 2028OTBa2 reference case scenario to replace historic fire emissions originally used in the 2028OTBa2 scenario while keeping constant all other U.S. anthropogenic, international, natural, and non-US fire emissions. The only differences between the 2028OTBa2 and the fire sensitivities are due to the FFS1 and FFS2 assumptions. Emissions development of the future fire sensitivities is described in the Air Sciences, Inc. report Fire Emissions Inventories for Regional Haze Planning: Methods and Results (April 2020). Modeling methods are defined in WRAP Future Fire Sensitivity Simulations (August 2021).

Theoretically, since the only differences between 2028OTBa2 and the FFS2 are the assumptions due to the increased acres treated in FFS2, one should be able to isolate the change in extinction on the most impaired days (MID) by calculating the incremental difference FFS2 and 2028OTBa2 by subtracting the 2028OTBa2 results from the FFS2 results.

Procedures

1. Get “Default” Rx fire adjustment from Product #5, WRAP TSS, Model Express Tools (“Adjustment Options for End of URP Glidepath”)

Figure 1- Example WRAP TSS Product #5, Model Express Tools

2. Subtract “End Point A – International” from “End Point B – International + Wildland Rx Fire”
 - a. Example: LOST1: B = 12.6 DV, A = 12.5 DV. Rx fire component of adjustment = B – A or 12.6 – 12.5, which yields 0.1 DV different or “default endpoint adjustment for Wildland Rx fire.
3. Convert Wildland Rx Fire DV to extinction units (Mm^{-1})
 - a. Obtain 2064 unadjusted end point in DV from Product #5, WRAP TSS (see figure 1 above, URP Glidepath)
 - i. Example: LOST1: end of the URP in 2064 = 5.9 DV
 - b. Add Wildland Rx Fire DV from Step 2 to Unadjusted 2064 end point from Step 1 and Subtract 2064 URP end point (unadjusted) to calculate Wildland Rx Fire contribution in extinction units by following formula: $10 \cdot \text{EXP}((2064_{\text{DV}} + \text{RxFire}_{\text{DV}})/10) - 10 \cdot \text{EXP}(2064_{\text{DV}}/10)$.
 - i. Example: GRCA2: $10 \cdot \text{EXP}((5.9 + 0.1)/10) - 10 \cdot \text{EXP}(5.9/10) = 0.18 \text{ Mm}^{-1}$

4. To calculate incremental contribution from WRAP Future Fire Scenario 2 (Increased Wildland Rx Fire ("FFS2")), obtain extinction results for 2028 OTBa2 scenario AND 2028 FFS2 scenario from WRAP TSS, Model Express tools, Product #18 ("Future Fire Sensitivities Visibility Projections – Most Impaired Days")
 - a.
 - i. 2028 OTBa2 results: stacked bar chart, column 2 = 39.37 Mm⁻¹ (Figure 2, "A")
 - ii. 2028 FFS2 results: stacked bar chart, column 4 = 39.82 Mm⁻¹ (Figure 2, "B")
 - b. Add Rayleigh scatter back to each value from steps 4.a.i and 4.a.ii
 - i. Example: LOST1: Rayleigh =11, so add Rayleigh back to 2028 OTBa2 and 2028 FFS2
 1. 2028 OTBa2 = 39.37; Rayleigh = 11; Total Bext = 50.37 Mm⁻¹
 2. 2028 FFS2 = 39.82; Rayleigh =11; Total Bext = 50.82 Mm⁻¹
 - c. Subtract total extinction, 2028 OTBa2 from total extinction, 2028 FFS2
 - i. Example: LOST1: 50.82 Mm⁻¹ (2028_{FFS2} Bext) – 50.37 Mm⁻¹ (Bext 2028_{OTBa2}) = 0.45 Mm⁻¹ (Bext_{Δ2028FFS2})
 - d. Difference from 4.c.i will yield the incremental increase of 2028_{FFS2} above 2028_{OTBa2} in extinction units (Mm⁻¹).
 - e. Convert the 2064 URP unadjusted endpoint into extinction units (Mm⁻¹)
 - i. Example: LOST1: Bext_{2064URP} = 10*EXP(DV_{2064URP}/10), or 10*EXP(5.9/10)
 - f. To calculate the "alternative glideslope adjustment" (which reflects the land management policy change of increasing acres treated with prescribed fire = Total ΔWildland Rx Fire which is the sum of 2028OTBa2 and FFS2 prescribed fire impacts in Mm⁻¹), add the incremental change in extinction units from 2028_{FFS2} (step 4.c.i) to the original projection from 2028_{OTBa2} in extinction units (step 3.b) and convert to deciview units by the following equation: 10*LN(((Bext_{Δ2028FFS2} (Mm-1) + Bext_{2028OTBa2}) + Bext_{2064URP})/10) – DV_{2064URP}

Figure 2 - Future Fire Sensitivities Total Extinction - Most Impaired Days

	2064			
Class I Area	Unadjusted	Rx Fire		Rx Fire (Mm-1)
THRO1		5.9	0.1	0.18
LOST1		5.9	0.1	0.18

	2064	2064			Total					
		unadjusted Mm-			2028 OTBa2	2028OTBa2	Total FFS2 (Mm-	FFS2 - 2028	Alternative	
Class I Area	Unadjusted (DV)	1	Rayleigh		(Mm-1)	(Mm-1)	1)	OTBa2 (Mm-1)	Glide slope (DV)	
THRO1	5.9	18.03988415		11	29.63	40.63	29.85	40.85	0.22	0.220015484
LOST1	5.9	18.03988415		11	39.37	50.37	39.82	50.82	0.45	0.343964942

D.2.c – Department Response to FLM Feedback

Response to Feedback Received from the Federal Land Managers During the Consultation Process

Under the Clean Air Act (CAA) Section 169A(d) and 40 Code of Federal Regulations (CFR) §51.308(i)(3), the State is required to consult with the appropriate Federal land managers during the development of the implementation plan. This document contains NDDEQ's responses to feedback received from the National Park Service (NPS) on November 19, 2021, and from the U.S. Forest Service (USFS) on November 17, 2021. The entirety of the feedback received from the Federal land managers is included in in Appendix D.2.a and D.2.b of the RH SIP revision.

National Park Service (NPS)

The NPS provided the Department (NDDEQ) with over 100 pages of comments separated into the following four sections: Executive Summary, Overarching feedback, Specific Review of Four-Factor Analyses, and Oil & Gas Area Source Recommendations.

As stated in the Executive Summary provided by NPS: *"The North Dakota draft SIP provides some of the best, technically sound four-factor analyses that the NPS has reviewed in this planning period. However, there are several recurring issues with the four-factor analyses that generally the inflated cost of controls."*

Establishment of a Cost Threshold

NDDEQ conducted four-factor analyses on each source selected through the screening analysis. NDDEQ has required everything that is appropriate and necessary to demonstrate reasonable progress during this planning period with this RH SIP revision.

NPS uses the term "cost-effectiveness". NDDEQ notes that "cost effectiveness" is a subjective term and is not used in the CAA Section 169A nor in 40 CFR §51.308. If the term "cost-effectiveness" is used, it must be understood that what was "cost-effective" previously may no longer be "cost-effective" today given current circumstances. A "cost-effectiveness" determination is made by the State under the CAA. In doing so, NDDEQ must follow "reasoned decision making" where "not only must an agency's decreed result be within the scope of its lawful authority, but the process by which it reaches that result must be logical and rational".¹ NDDEQ followed this process by considering all the available data and results prior to reaching the state's determinations set forth in the proposed RH SIP revision. As a result, North Dakota does not believe it is appropriate or necessary to establish a "cost-threshold in line with other states or based on NDDEQ thresholds from previous rounds" for this planning period of the regional haze program. The projected impact resulting from additional control must be considered prior to requiring any control measures which fall below a set cost threshold.

North Dakota Class I areas are currently below the adjusted uniform rate of progress needed to achieve the 2064 visibility end goals and North Dakota Class I areas are projected to remain below the adjusted uniform rate of progress in 2028. Being under the adjusted uniform rate of progress demonstrates that

¹ See *Michigan v. Environmental Protection Agency*, 576 U.S. 743, 750 (2015).

North Dakota is on track to accomplish the goals of the regional haze program. This was not used as a safe harbor, as four-factor analyses were completed by NDDEQ, but was factored into the decision-making. NDDEQ will continue to track Class I area visibility and will reevaluate what appropriate costs of controls may be in future regional haze planning periods.

In addition, NPS raised the Chemical Engineering Plant Cost Index (CEPCI) values in their feedback. CEPCI, the gold standard for adjusting plant costs and used in EPA's cost control spreadsheets, was up 28.5% since the cost analyses were performed and submitted to NDDEQ.² This means all the costs presented in the control measures evaluations are likely underestimated by almost 30% when compared to today's dollar. The 2018 CEPCI value was 603, while the final value for October 2021 was 761. See the following table for an accurate expectation of how underpredicted the costs presented in the four-factor analyses are.

Year	CEPCI	Year to Year Increase
2018	603.1	--
2019	607.5	0.7%
2020	596.2	-1.9%
2021 Oct	761.4	26.5%
2021 Nov	773.1	28.5%

North Dakota's correlation of low visitation with MID

The information provided in Section 1.3.2 of the RH SIP revision was not used to determine whether controls should be required. This information was provided to help show a more complete story of regional haze and to highlight a significant area of concern regarding the regional haze programs most impaired days metric for North Dakota Class I areas. The information provided in the RH SIP revision Section 1.3.2 helps highlight what is generally known by the public throughout the state of North Dakota, that the most significant air quality problems and corresponding visibility impairment results from out of state wildfires, and these fires coincide with times park visitation is the highest. While beyond the scope of this RH SIP, reducing the wildfire impacts would provide the single greatest benefit to visibility improvement while simultaneously reducing the health-based impacts from wildfire smoke. This is important background information of which all parties should be aware.

Visibility Benefits, URP, and IMPROVE Data Trends

Overview

As mentioned by NPS, NDDEQ's long-term strategy does not include additional controls for any of the sources selected for four-factor analysis and NDDEQ agrees that there are technically feasible control options available for several units. However, as outlined in "Establishment of a Cost Threshold" of this response to comment document, the additional technically feasible control options on the four-factor sources are not "cost-effective." And, as explained in the proposed RH SIP revision, North Dakota

² Available at: <https://www.toweringskills.com/financial-analysis/cost-indices/> (last visited April 7, 2022)

determination is that it is not “reasonable” to require these control options based on the following considerations:

- the lack of visibility impairment currently caused by anthropogenic sources located in North Dakota (Section 3.1 of the proposed RH SIP revision)
- the lack of modeled visibility improvement when additional control scenarios were evaluated based on NDDEQ’s four-factor analyses (Section 6.1.1 of the proposed RH SIP revision)
- North Dakota Class I areas are currently below the adjusted uniform rate of progress (URP) needed to achieve the 2064 visibility end goals and North Dakota Class I areas are projected to remain below the adjusted URP in 2028 (Section 3.2.7 and 6.1.1 of the proposed RH SIP revision)
- the excellent air quality currently maintained by North Dakota when significant wildfires are not occurring outside the state and impacting North Dakota’s air (Air Quality in North Dakota Section and Section 3.3. of the proposed RH SIP revision)

This information supports North Dakota’s determination not to recommend additional controls for round 2 of regional haze. Should any of these considerations change in the future, NDDEQ will reevaluate this decision. The regional haze program set an end goal target date of 2064 and broke the program into decadal planning periods with the understanding that improvements would not be made all at once. Each round should be evaluated separately with the end goal in mind, making improvements at a reasonable pace while not overburdening essential industries. North Dakota made substantial improvements in round 1 (Section 1.3 of the proposed RH SIP) and is on track to meet the 2064 end goals of the program.

Visibility Benefits and URP

NDDEQ agrees with NPS statements regarding the URP and that simply being under the URP is not a “safe harbor” or reason for a recommendation of no controls. However, NDDEQ did not rely on being under the URP as a “safe harbor” or as the basis for North Dakota’s determinations. Many factors, as explained throughout North Dakota’s proposed RH SIP revision and this response to comment were used to conclude no additional controls for regional haze are warranted in this planning period.

The demonstration that North Dakota Class I areas remain below the URP and are projected to remain below the URP through 2028 shows that North Dakota has and is expected to continue to show reasonable progress toward improving visibility through 2028 and is on track to accomplish the 2064 end goal of the program. North Dakota’s projected level of visibility improvement on the most impaired days meets a core requirement of the regional haze program requirements. 40 CFR 51.308(f)(3)(i) states in part *“The long-term strategy and the reasonable progress goals must provide for an improvement in visibility for the most impaired days since the baseline period and ensure no degradation in visibility for the clearest days since the baseline period.”* The information provided by NDDEQ indicates North Dakota Class I areas are expected to meet these core requirements of the rule, see Section 3.1 and Section 6.1 of the proposed RH SIP revision. North Dakota considered the rate of progress made to improve visibility and the lack of cost reasonable controls as key factors to reject additional controls, beyond what is currently proposed, for round 2 of the regional haze program.

IMPROVE Data Trends

NPS states that overall visibility impairment trends in the area are improving but recent years (2016-2019) have experienced increases on the most impaired days. NDDEQ notes that 2019 was an incomplete data year for Theodore Roosevelt National Park.³ NPS suggests continuous emissions reductions are needed to meet the 2064 goals and the uniform rate of progress glideslope is a planning tool and not a standard. This paragraph concludes that no state has met the 2064 end goal yet. NDDEQ notes two items. 1) the referenced data is volatile from year to year, which is why five-year averaging periods are used. A simple review of most Class I areas across the western U.S. shows this volatility and overreacting to one year of data is a misuse of the information. 2) 2020 visibility impairment data for the most impaired days in Theodore Roosevelt indicates one of the lowest amounts of annual most impaired days visibility impairment on record, only behind 2016, 2015, and 2014, respectively. It is also noted that 2014, the height of development in the Williston Basin oil field, has the 3rd lowest annual most impaired days visibility impairment on record for Theodore Roosevelt National Park.

Response to Selective Catalytic Reduction (SCR) Determinations

Of note prior to addressing specifics in the following sections, SCR is generally control technology which can be used to reduce NO_x emissions from fossil fuel combustion. NO_x emissions contribute to and result in ammonium nitrate light extinction. Ammonium nitrate light extinction from North Dakota coal fired electrical generating utilities are projected to account for 0.4% and 1% of the 2028 total light extinction on the most impaired days at Theodore Roosevelt National Park and Lostwood Wilderness Area, respectively. In other words, eliminating 100% of NO_x emissions from North Dakota electrical generating utilities would result in a maximum projected improvement in visibility of 1% on these days. SCR cannot achieve a 100% percent reduction, meaning this 1% improvement is unobtainable even if installed on every North Dakota electrical generating utility.

Technical feasibility of SCR on all boiler types

NDDEQ agrees that technically feasible control options need to be both available and applicable. NPS correctly states that SCR is available, but this statement is misleading for North Dakota sources. SCR has never been demonstrated in practice on North Dakota lignite fired boilers. SCR has never been through the licensing and commercial demonstration in North Dakota; and has experienced no commercial sales for North Dakota lignite fired boilers. The regional haze best available retrofit technology (BART) guidelines⁴ states *“A control technique is considered available, within the context presented above, if it has reached the stage of licensing and commercial availability. Similarly, we do not expect a source owner to conduct extended trials to learn how to apply a technology on a totally new and dissimilar source type. Consequently, you would not consider technologies in the pilot scale testing stages of development as “available” for purposes of BART review”*. SCR has been demonstrated in practice, but never on units firing North Dakota lignite. Further the BART guidelines also state *“Technologies which have not yet been applied to (or permitted for) full scale operations need not be considered as available; we do not expect the source owner to purchase or construct a process or control device that has not*

³ 2019 was incomplete, in part, due to the federal government shutdown.

⁴ Appendix Y to Part 51 - Guidelines for BART Determinations Under the Regional Haze Rule

already been demonstrated in practice.” In summary, this is the case for North Dakota. Therefore, questions on SCR availability and applicability for North Dakota lignite have not been resolved.

Tangentially- and Wall-Fired Boilers

NDDEQ conservatively carried TE-SCR on tangentially-fired and wall-fired boilers burning North Dakota lignite forward for cost evaluation, even though uncertainty remains regarding the real-world feasibility on North Dakota lignite boilers.

Cyclone-Fired Boilers

NDDEQ agrees that no demonstration has been provided showing TE-SCR technical feasibility on cyclone boilers burning North Dakota lignite. Therefore, this technology was removed from consideration for cyclone units.

Catalyst Deactivation

NDDEQ agrees that catalyst deactivation is normal, and the rate of deactivation is an economic factor rather than a technical-feasibility issue. Catalyst deactivation was not used as rational for not recommending SCR controls.

NDDEQ appreciates NPS’s recognition of the unique characteristics of North Dakota lignite flue gas and acknowledgement of the SCR pilot testing performed in the early 2000s. As NPS stated, *“North Dakota lignite contains relatively high levels of organically associated alkali and alkaline-earth elements, including Na, Ca, K, and magnesium. Na levels in North Dakota lignite are typically 5 to 20 times higher than Na levels in bituminous and subbituminous coals, and Na compounds can represent between 5% and 11% of the ash generated from firing ND lignite.”* Since that pilot testing was performed, cyclone boiler fly ash sampling at the scrubber outlet has shown that submicron particles of sodium and potassium are still present. These particles have the potential to interact with and penetrate low dust or tail end SCR.⁵

SCR NOx Rates

NDDEQ generally agrees that SCR can achieve NOx rates as low as 0.04 lb/MMBtu at non-lignite facilities. However, this has not been demonstrated and is likely untrue for North Dakota lignite sources. Significant pilot testing, optimization and tuning, and time would be needed to determine a sustainable NOx rate for North Dakota sources. Further, NDDEQ notes that none of the 11 listed EGUs in the NPS comments are in North Dakota and none of them burn North Dakota lignite coal. Many, if not all, NPS noted facilities appear to combust bituminous or subbituminous coal and none of the referenced units were cyclone fired boilers. As such, NDDEQ believes it is not accurate to compare dissimilar units and assuming the same outcome is achievable.

TE-SCR for cyclone boilers combusting North Dakota lignite is still considered technically infeasible. Coyote Station did, however, initially include and carry TE-SCR forward for cost evaluation with a

⁵ Benson, Schulte, Patwardhan, Jones. (2021) “The Formation and Fate of Aerosols in Combustion Systems for SCR NOx Control Strategies”. A&WMA’s 114th Annual Conference, paper# 983723.

predicted achievable NOx emissions rate of 0.09 lb/MMBtu.⁶ TE-SCR was ultimately removed for consideration from this facility due to the technology being unproven.⁷

Since TE-SCR is an unproven technology on North Dakota lignite boilers, a NOx emissions rate of 0.04 lb/MMBtu would never be proposed by NDDEQ. For non-cyclone units, NDDEQ already addressed the selection of appropriate NOx rates for analysis in Appendix A, supported by the control measures evaluations included in Appendix B.

SCR Capital and Operating Costs

NDDEQ does not agree that the capital and operating costs of TE-SCR warrant further evaluation. Rather, ND determined that the exorbitant cost of TE-SCR quickly eliminates it as an economically feasible control option for round 2 of regional haze. Since the technology is dismissed due to extreme costs, the technical feasibility uncertainty is inherently less of less concern. If anything, coupling the very high cost with the uncertainty leads to a clear decision to not recommend TE-SCR, or SCR in any configuration.

Further, NPS incorrectly provided “updated or corrected” costs based on a high-dust configuration SCR (the EPA cost control manual spreadsheets utilize SCR in the high-dust configuration).

NDDEQ compiled the cost estimates from all four-factor sources which evaluated the costs of TE-SCR to highlight the significance of these costs, see table below. The average capital cost for TE-SCR systems is projected to be over \$200,000,000 (\$200 million) with annualized costs ranging between \$15,000,000 and \$41,000,000 (\$15–41 million).

Cost Comparison of SCR for North Dakota Lignite Fired Sources

Facility	Boiler Type	Baseline NOx Emissions Rate (lb/MMBtu)	Technology	NOx Emissions Rate (lb/MMBtu)	Total Capital Investment (MM\$)	Annualized Cost (MM\$)	Cost per Emissions Reduced (\$/ton) - Projected
Coal Creek Station, Unit 1 and 2	Tangentially -Fired	0.18 ^A	TE-SCR ^B	0.06	191.7	16.7	6,280
				0.08	180.0	15.4	6,980
Antelope Valley Station, Unit 1 and 2	Tangentially -Fired	0.11	TE-SCR	0.05	221.4	36.3	34,750
Leland Old	Opposed Wall-Fired	0.16	TE-SCR	0.05	227.7	33.7	42,320

⁶ Appendix B.1.b., page 5-36 through 5-39. PDF pages 70–73.

⁷ TE-SCR was also not considered feasible for the other Cyclone boilers in North Dakota. Which include Coyote, Leland Olds Station Unit 2, Milton R. Young Station Units 1 and 2.

Facility	Boiler Type	Baseline NOx Emissions Rate (lb/MMBtu)	Technology	NOx Emissions Rate (lb/MMBtu)	Total Capital Investment (MM\$)	Annualized Cost (MM\$)	Cost per Emissions Reduced (\$/ton) - Projected
Station, Unit 2							
Coyote Station	Cyclone-Fired	0.46	TE-SCR ^C	0.09	254.1	41.3	7,300

^A The current emissions rate is ~0.13 lb/MMBtu. Using this value changes the \$/ton to \$10,340 and \$13,370 for target rates of 0.06 and 0.08 lb/MMBtu, respectively.

^B Costs are for a high-dust SCR system. High-dust SCR is not technically feasible but is significantly less expensive. Therefore, the total capital investment, the annualized costs, and the \$/ton of a TE-SCR would be significantly greater. Couple this with the lower baseline rate discussed in Footnote A, and the costs will become even greater.

^C This technology is not technically feasible. Regardless, the costs demonstrate the lack of economic feasibility eliminating any need to discuss technical feasibility uncertainty.

Response to Reasonable Progress Cost of Compliance and Inflated Costs of North Dakota's Four Factor Analyses

NPS noted four considerations it believes result in an overestimation of control costs. Each of these items shall be addressed, but it is noted that the response provided in "Establishment of a Cost Threshold" takes precedence over these items. The four cost items NPS raised as issues are:

- Contingency cost of direct and indirect capital costs to all capital projects (20% vs 10%)
- Direct costs as owners' costs (2%)
- Property taxes, insurance, and administrative charges (1%, 1%, 2%)
- Interest rate and equipment life (5.25% vs 3.25% and 20-years vs 30-years)

NPS carried each of these four cost item bullets forward to "correct" the "inflated costs" presented by NDDEQ. As explained in the following sections, the NDDEQ believes NPS utilized inappropriate cost "corrections" and NDDEQ used appropriate cost information in its four factor analyses.

Contingency

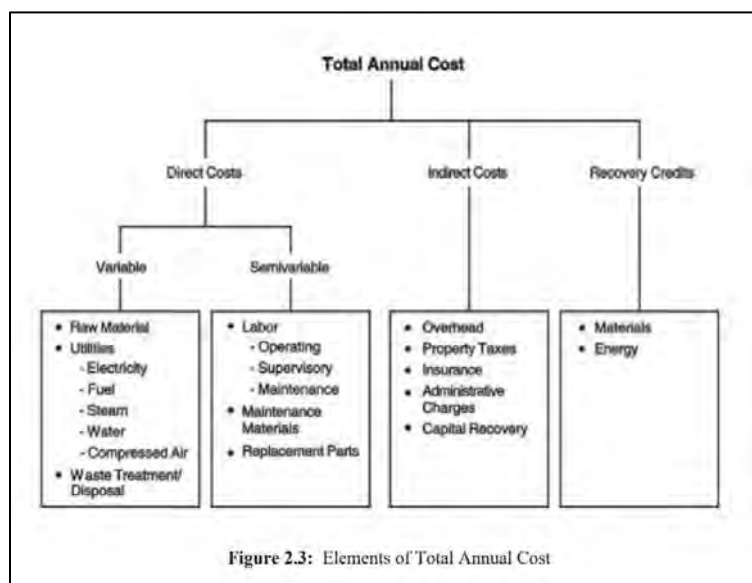

NDDEQ used a consistent contingency factor of 20% for similar sources during this review and believes it to be accurate value to utilize at this stage of control cost estimation. Using a consistent contingency factor amongst the sources holds everyone to a level playing field when control costs are initially evaluated. Contrary to EPA's cost control manual 'default' contingency recommendation of 10%, there is no such thing as a standard contingency factor. Contingency factors change depending on the level of cost projected and become smaller (more accurate) as more detailed cost estimates are completed.

Owner's Cost

NPS provide no support for the statement that owners costs are not allowed by EPA. Owner's costs (e.g., staff time) are real and should be considered. Further, this is only 2% of the direct capital cost and does not materially change any conclusions reached.

Property Taxes, Overhead, and Insurance

NPS misrepresents the cost control manual stance on property taxes, overhead, and insurance. NDDEQ has included the figure below from EPA's Cost Control Manual, Chapter 2, Section 2.4.2, Figure 2.3 (page 13)⁸. As shown in the following figure, each of these items NPS takes issue with is listed as a cost associated with the total annual cost, specifically, the indirect costs.

Interest rate and equipment life

Based on consideration of the NPS' feedback, the NDDEQ continues to believe the decision to use an interest rate of 5.25% and a 20-year equipment life for the second planning period is appropriate. The interest rate was the bank prime rate at the time these analyses were prepared, and 20-years is a reasonable equipment life.

The interest rate in the four factor analyses was consistent with the bank prime rate at the time the evaluations were performed. At that time, the rate of 5.25% was confirmed by EPA Region 8.⁹ Additionally, using a consistent interest rate amongst the sources holds everyone to a level playing field when control costs are initially evaluated. NPS provides no reference to a statute or regulation to justify why NDDEQ should use lower interest rates for the controls evaluated. Further, lowering the interest rate has no impact on the overall decision as the impact of the controls reviewed toward improving

⁸ Available at: https://www.epa.gov/sites/default/files/2017-12/documents/epacmcostestimationmethodchapter_7thedition_2017.pdf

⁹ NDDEQ proposed RH SIP revision, Appendix E, page E.2-130 and E.2-131.

visibility is the first question that must be answered. Even if the interest rate is lowered, it does not materially change any determinations made by NDDEQ.

For consistency of cost estimations between sources and technologies, NDDEQ believe it is reasonable to use an equipment life (or more properly, a loan amortization period) of 20 years. Using consistent equipment life amongst the sources holds everyone to a level playing field when control costs are initially evaluated.

[Response to request for upstream oil and gas regulations](#)

Thank you for the comment regarding North Dakota Oil and Gas upstream operations. In lieu of addressing each comment section individually, NDDEQ addresses all three sections comments with the following response.

NDDEQ has addressed wellsite NO_x emissions from NDDEQ regulated sources in the RH SIP revision in Section 5.2.11. NDDEQ notes that federal engines rules under NSPS JJJJ, NSPS IIII, and MACT ZZZZ already exist and contain NO_x emission standards. NDDEQ is the delegated authority for NSPS JJJJ, NSPS IIII, and MACT ZZZZ (for major sources) while EPA Region 8 maintains authority for MACT ZZZZ for area sources. NO_x engine emissions concerns from sources under EPA Region 8 authority should be directed toward EPA Region 8 given that federal agency has regulatory authority over approximately 20% of the oil and gas operations in North Dakota on Tribal land. NDDEQ sent letters to each of the Tribal partners in the state requesting feedback on the proposed RH SIP revision but, to date, has not received any comments in response.

On Nov. 2, 2021, EPA has proposed additional federal rules for the oil and gas sector. These rules include updates to the existing New Source Performance Standards (NSPS) OOOO (2012) and NSPS OOOOa (2016) standards, a new NSPS OOOOb standard for post-2021 sources, and emissions guidelines for existing designated facilities under a NSPS OOOOc standard (pre-2012 sources). The NSPS OOOOc standard may require NDDEQ to develop a CAA Section 111(d) plan which, at a minimum, meets EPA emissions guidelines under NSPS OOOOc.

U.S. Forest Service (USFS)

The USFS provided the NDDEQ with two pages of comments separated into the five topics. These topics included: relevance of visibility impact of individual sources, visibility impacts during peak/off peak visitation, cost effective controls identified but not considered, contribution of North Dakota emissions to neighboring state class I areas, and prescribed fire emissions.

The USFS comments stated: *“The USFS recognizes and applauds the significant emission reductions made in North Dakota since the early 2000’s. Further, we appreciate the strong working relationship among our respective staff and the routine communications during the development of this draft Regional Haze plan.*

Overall, the USFS finds that the draft SIP is well organized and comprehensive. We specifically appreciate the thorough and technically sound ‘four factor analyses’ included in the draft SIP.” NDDEQ thanks USFS for this feedback and appreciates the working relationship between staff.

Response to Relevance of the Visibility Impact of Individual Sources

NDDEQ does not believe USFS accurately portrayed NDDEQ’s summary conclusions presented in the North Dakota’s RH SIP revision. NDDEQ did consider the installation of additional controls, as is covered in detail throughout the RH SIP revision. The executive summary in the RH SIP revision sets forth various considerations made by North Dakota prior to coming to the conclusions presented. Further, Section 2 to provide a more robust description of the State’s RH SIP revision development process.

“Cost-effective” controls are further addressed in the NPS response above “Establishment of a Cost Threshold”.

Response to Visibility Impacts During Peak/Off Peak visitation

NDDEQ has considered all aspects of visibility impairment, as presented throughout the RH SIP revision. Visitation and visibility impacts are further addressed in the NPS response above “North Dakota’s correlation of low visitation with MID”.

Response to Cost Effective Controls Identified, But Not Considered

See NPS response above under “Establishment of a Cost Threshold” for NDDEQ’s position on this matter. Consistent with USFS recommendation, but in contrast to their statement, NDDEQ has proposed NO_x limits at Coal Creek of 0.15 lb/MMBtu on a 30-day rolling average. See Appendix F of the RH SIP revision.

Response to Contribution of North Dakota Emissions to Neighboring State Class I Areas

NDDEQ has consulted with, reached out too, and provided many opportunities for South Dakota Department of Agriculture and Natural Resources to identify sources or areas of concern regarding visibility impacts coming from North Dakota.

NDDEQ notes that the Wind Canyon National Park in South Dakota is projected to exceed the visibility end goals by 2028 and Badlands National Park is only 2.2 deciviews away from achieving this target. This

likely played a significant role in South Dakota's decision to not reach out to NDDEQ and request additional controls for regional haze during this planning period.

Response to Prescribed Fire Emissions Comments

NDDEQ agrees with the information provided by USFS and as addressed many times in the RH SIP revision, believes fires are of the upmost importance. This is true regarding both prescribed and extreme wildfire events. NDDEQ supports USFS statement that *"Fire and fuels management supports a variety of desired conditions and objectives across the forests and grasslands (e.g., community protection, hazardous fuels reduction, native ecosystems restoration, historic fire regimes restoration, wildlife openings, and open woodland creation, etc.). The USFS along with our partners, including the North Dakota Forest Service (NDFS), plan to increase the use of prescribed fire to accomplish these goals."* NDDEQ recommends, as identified in the Grand Canyon Visibility Transport Commission report, that USFS and partners also increase efforts to reduce the excessive fuel loads through utilization of mechanical treatments where appropriate.

D.3 – Public Record

D.3.a – Public Hearing Notice

Stroh, David E.

From: Stroh, David E.

Subject: North Dakota Proposed Regional Haze SIP Revision Notice
Attachments: 20220418_EPAR8.pdf; Notice_of_Intent.pdf

Attached is a signed electronic notice and notice of intent to issue for the North Dakota Department of Environmental Quality (NDDEQ) proposed regional haze state implementation plan (RH SIP) revision for public comment. This plan is being made available to provide you with an opportunity to comment on NDDEQ's proposed RH SIP revision.

The location of the material available for review is included in the attached notice and can be found at:

<https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>

(note: webpage and material will be updated prior to April 27th)

Comments can be sent through the mail or electronically to: AirQuality@nd.gov

If electronic comments are provided, please include "Regional Haze Public Comments" in the subject line.

Please review the attached and reach out with any comments or questions.

Regards,

David

David Stroh

Environmental Engineer

4201 Normandy St., Bismarck, ND 58503-1324

Notice of Intent
To Amend the State Implementation Plan
For Air Pollution Control
Relating to the Regional Haze Rule

North Dakota
Department of Environmental Quality

will hold an in-person public hearing to address proposed changes to the State Implementation Plan (SIP) for the Control of Air Pollution for the State of North Dakota which addresses Regional Haze (RH) in the Federal Class I areas.

Normandy Building
4201 Normandy Street (Room 223)
Bismarck, ND
May 31, 2022
9:00 a.m. CDT

For those unable to attend in-person, a virtual listening option has been made available on the Department's Regional Haze webpage: <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>. A copy of the proposed RH SIP revision and supporting documentation may be accessed at the above link. A copy of the proposed RH SIP revision may also be obtained by writing to the North Dakota Department of Environmental Quality, Division of Air Quality, 4201 Normandy Street, Bismarck, North Dakota 58503 or calling (701)328-5188. Written comments may be submitted to the above address on or before June 1, 2022. The RH SIP revision addresses the requirements to show reasonable progress to reduce regional haze (visibility impairment) in Theodore Roosevelt National Park (TRNP) and Lostwood Wilderness Area (LWA). The RH SIP revision includes a Permit to Construct for Coal Creek Station which establishes a limit of nitrogen oxides intended to improve visibility conditions in TRNP and LWA.

The National Park Service is the Federal Land Manager for TRNP and provided comments on the draft RH SIP revision. The U.S. Fish and Wildlife Service is the Federal Land Manager for LWA and did not provide comment on the draft RH SIP revision. The Department also received comments from the U.S. Forest Service on the draft RH SIP revision. The comments received can be found in Appendix D.2 of the RH SIP revision. These comments may be accessed at the website listed above or by contacting the Department. The Department has provided a written response to these comments in Appendix D.2.

If you plan to attend the hearing and will need special facilities or assistance relating to a disability, please contact the Department of Environmental Quality at the above address at least seven days prior to the hearing.

Dated this 18th day of April 2022

James L. Semerad

Re: Regional Haze State Implementation Plan Revision for Public Comment

Erin Fox-Dukart:

The North Dakota Department of Environmental Quality, Division of Air Quality (Department) has developed a State Implementation Plan (SIP) Revision to address the Regional Haze (RH) requirements of 40 CFR 51.308. The proposed RH SIP revision may be viewed at the Department's office, 4201 Normandy Street, Bismarck, North Dakota or at the Department's website at: <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>. A copy of the proposed RH SIP revision may be requested by writing the Department at the above address or by calling (701)328-5188. Also included is a notice announcing a public hearing that will be held to accept oral testimony regarding the proposed RH SIP revision. The hearing is scheduled for May 31, 2022. The Department welcomes any comments you or your staff may have regarding the RH SIP revision. All comments received by June 1, 2022, will be included as part of the public record. Written comments must be sent to the address listed above or submitted via email to AirQuality@nd.gov. Comments submitted via email should include "Regional Haze Public Comments" in the subject line.

You are invited to attend and present testimony at the hearing. If you plan to attend the hearing and will need special facilities or assistance relating to a disability, please contact the Department at the above telephone number or address at least seven days prior to the hearing.

If you have any questions, please contact David Stroh of my staff at (701)328-5229.

Sincerely,

James L. Semerad

Re: Regional Haze State Implementation Plan Revision for Public Comment

Chairman Azure:

The North Dakota Department of Environmental Quality, Division of Air Quality (Department) has developed a State Implementation Plan (SIP) Revision to address the Regional Haze (RH) requirements of 40 CFR 51.308. The proposed RH SIP revision may be viewed at the Department's office, 4201 Normandy Street, Bismarck, North Dakota or at the Department's website at: <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>. A copy of the proposed RH SIP revision may be requested by writing the Department at the above address or by calling (701)328-5188. Also included is a notice announcing a public hearing that will be held to accept oral testimony regarding the proposed RH SIP revision. The hearing is scheduled for May 31, 2022. The Department welcomes any comments you or your staff may have regarding the RH SIP revision. All comments received by June 1, 2022, will be included as part of the public record. Written comments must be sent to the address listed above or submitted via email to AirQuality@nd.gov. Comments submitted via email should include "Regional Haze Public Comments" in the subject line.

You are invited to attend and present testimony at the hearing. If you plan to attend the hearing and will need special facilities or assistance relating to a disability, please contact the Department at the above telephone number or address at least seven days prior to the hearing.

If you have any questions, please contact David Stroh of my staff at (701)328-5229.

Sincerely,

James L. Semerad

D.3.b – Press Release

NEWS | **FOR IMMEDIATE RELEASE** | April 19, 2022

Department of Environmental Quality schedules public hearing to address air pollution control plan

BISMARCK, N.D. – The North Dakota Department of Environmental Quality has scheduled a public hearing to address proposed changes to the North Dakota State Implementation Plan for air pollution control on May 31 at 9:00 a.m. at 4201 Normandy Street in Bismarck. The hearing will address Environmental Quality's plan revision for addressing haze (visibility impairment) in Theodore Roosevelt National Park and the Lostwood National Wildlife Refuge Wilderness Area. See further details at <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>.

Environmental Quality will accept in-person oral testimony from the public during the hearing. The public may also listen online at <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>.

Environmental Quality will accept written comments regarding the changes by June 1, 2022. Please address written comments to James L. Semerad, Division of Air Quality, North Dakota Department of Environmental Quality, 4201 Normandy Street, Bismarck, ND 58503, or email them to airquality@nd.gov with Public Comment for Air Pollution Control SIP in the subject line.

Environmental Quality will consider every request for reasonable accommodation to provide an accessible meeting facility or other accommodation for people with disabilities, language interpretation for people with limited English proficiency, and translations of written material necessary to access programs and information. To request accommodations, contact Jennifer Skjod, Public Information Officer at 701-328-5226 or jskjod@nd.gov. TTY users may use Relay North Dakota at 711 or 1-800-366-6888.

D.3.c – Affidavit of Publication

Affidavit of Publication

Hannah Hertz, being duly sworn, states as follows:

1. I am the designated agent, under the provisions and for the purposes of, Section 31-04-06, NDCC, for the newspapers listed on the attached exhibits.

2. The newspapers listed on the exhibits published the advertisement of:
**ND Department of Environmental Quality, Division of Accounting,
Notice of Intent... Relating to the Regional Haze Rule, 1 time(s)** as required by law or ordinance.

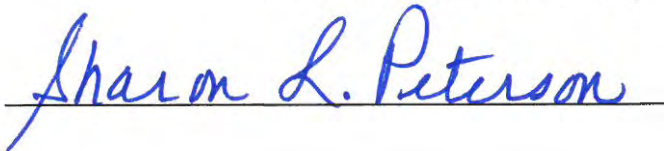

3. All of the listed newspapers are legal newspapers in the State of North Dakota and, under the provisions of Section 46-05-01, NDCC, are qualified to publish any public notice or any matter required by law or ordinance to be printed or published in a newspaper in North Dakota.

Signed: 

State of North Dakota

County of Burleigh

Subscribed and sworn to before me this 7th day of June, 2022.

Iowa GOP open to non-Trump prospects in 2024

THOMAS BEAUMONT
Associated Press

DES MOINES, Iowa — Former President Donald Trump’s persistent flirtation with another White House run is doing little to discourage other potential Republican candidates from stepping up their activity in Iowa, the state that will formally launch the 2024 nomination process.

Former Secretary of State Mike Pompeo quietly finished his fifth trip to Iowa earlier this month, and former U.N. Ambassador Nikki Haley is making plans for a statewide trip this summer. Former Vice President Mike Pence, meanwhile, visited the heart of conservative western Iowa over the weekend.

Pence’s trip is particularly notable since he spent the better part of four years in lockstep with Trump. It provides further evidence that Pence, whose life was threatened by Trump supporters during the violent Jan. 6 insurrection at the U.S. Capitol, is considering his political future without regard to the former president’s plans.

From his Mar-a-Lago resort in Florida, Trump is closely watching the developments in Iowa and working with operatives in the state to ensure that he would

dominate the caucuses if he decided to run again. But some Republicans warn Trump doesn’t have the state locked down.

His status as a former president who remains deeply popular with the GOP base “doesn’t mean someone else with the right message couldn’t appeal to them in a way that really cuts into Trump’s support,” said David Kochel, a veteran Iowa Republican campaign strategist.

Pence, in particular, seems prepared to dig in to the state, especially the sprawling swath of northern and western Iowa where Christian conservatives have lifted the past three GOP caucus winners. Making his third trip to Iowa since the 2020 election, Pence campaigned Saturday with Rep. Randy Feenstra.

Last month, he outlined a policy agenda for 2022 candidates, noting “elections are about the future.” The comment could foreshadow a confrontation with Trump, who continues to falsely

Pompeo

Haley

Pence

insist that wide-spread voter fraud cost him a second term in 2020.

Federal and state election officials and Trump’s own attorney general have said there is no credible evidence the election was tainted. The former president’s allegations of fraud were also roundly rejected by courts, including by judges Trump appointed.

Still, Trump has criticized Pence for not stopping the certification of the Electoral College vote totals that made Democrat Joe Biden the winner. Vice presidents play only a ceremonial role in the counting of Electoral College votes.

Only this year did Pence publicly renounce Trump’s claims, saying in February the former president was “wrong” to insist that he had the power to unilaterally overturn the results of the 2020 election. He further distanced himself from Trump after Russia invaded Ukraine. Pence said, “There is no room in this party for apologists” for

Russian leader Vladimir Putin, whom Trump has praised.

The GOP’s full court press in Iowa won’t likely begin until after the November midterm elections. But the party has already committed to maintaining the state’s status as home to the first nominating contest. That’s in contrast to Democrats, who are taking the boldest steps in a generation to revise their calendar and potentially concentrate power in states that are more racially diverse.

Pompeo has been a regular visitor to Iowa, but it’s Arkansas Sen. Tom Cotton who owns the early lead for Iowa visits at six, with a seventh planned for July.

Texas Sen. Ted Cruz, the 2016 Iowa GOP caucus winner, has also visited and endorsed candidates for Congress. Despite the activity, it’s unclear that anyone visiting the state is gaining much traction among Iowa GOP activists at this early stage. During recent interviews with a dozen county Republican activists, GOP consultants and donors, much of the focus was on Florida Gov. Ron DeSantis, who has yet to visit the state.

DeSantis, governor of the

nation’s third most-populous state, has recently become a rallying voice in the country’s cultural battles, particularly related to LGBTQ issues. He has refused to recognize the transgender swimmer who won the NCAA women’s freestyle championship. He signed a bill last month forbidding instruction on sexual orientation or gender identity for early elementary school students, a measure opponents have dubbed the “Don’t Say Gay” law.

Influential Republican donors, such as retired insurance executive Cam Sutton of suburban Des Moines, describe DeSantis as similar to Trump on policy, “but without the tweets.”

Sutton was among a contingent of wealthy Iowa Republicans who traveled to New Jersey in 2011 in hopes of recruiting then-Gov. Chris Christie to run in 2012. Sutton and others remain in touch with Christie and would not be surprised if he runs, as he did in 2016.

Still, Trump remains overwhelmingly popular among Iowa Republicans. According to The Des Moines Register’s Iowa Poll in October, 91% of Iowa Republicans said they have a favorable view of him.

4/18 & 25 - 45296

NOTICE OF INTENT TO AMEND THE STATE IMPLEMENTATION PLAN FOR AIR POLLUTION CONTROL Relating to the Regional Haze Rule North Dakota Department of Environmental Quality (“Department”)

will hold an in-person public hearing to address proposed changes to the State Implementation Plan (SIP) for the Control of Air Pollution for the State of North Dakota which addresses Regional Haze (RH) in the Federal Class I areas.

**Normandy Building
4201 Normandy Street
(Room 223)
Bismarck, ND
May 31, 2022
9:00 a.m. CDT**

For those unable to attend in-person, a virtual listening option has been made available on the Department’s Regional Haze webpage: <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>. A copy of the proposed RH SIP revision and supporting documentation may be accessed at the above link. A copy of the proposed RH SIP revision may also be obtained by writing to the North Dakota Department of Environmental Quality, Division of Air Quality, 4201 Normandy Street, Bismarck, North Dakota 58503 or calling (701)328-5188. Written comments may be submitted to the above address on or before June 1, 2022. The RH SIP revision addresses the requirements to show reasonable progress to reduce regional haze (visibility impairment) in Theodore Roosevelt National Park (TRNP) and Lostwood Wilderness Area (LWA). The RH SIP revision includes a Permit to Construct for Coal Creek Station which establishes a limit of nitrogen oxides intended to improve visibility conditions in TRNP and LWA.

The National Park Service is the Federal Land Manager for TRNP and provided comments on the draft RH SIP revision. The U.S. Fish and Wildlife Service is the Federal Land Manager for LWA and did not provide comment on the draft RH SIP revision. The Department also received comments from the U.S. Forest Service on the draft RH SIP revision. The comments received can be found in Appendix D.2 of the RH SIP revision. These comments may be accessed at the website listed above or by contacting the Department. The Department has provided a written response to these comments in Appendix D.2.

If you plan to attend the hearing and will need special facilities or assistance relating to a disability, please contact the Department of Environmental Quality at the above address at least seven days prior to the hearing.

Dated this 18th day of April 2022

NOTICE OF PROPOSALS

(Sec. 11-11-16 and 54-44.7 NDCC)
NOTICE IS HEREBY GIVEN that the Burleigh County Board of Commissioners, Burleigh County, North Dakota will accept proposals until Wednesday, May 25, 2022 at 1:30 P.M. (Local Time). Proposals will be opened at that time in County Auditor/Treasurer Office, located at 221 N 5th St in Bismarck, ND. After an evaluation and selection process the results will be presented to the County Commission on Monday, June 6, 2022, beginning approximately at 5:00 PM (Local Time), in the Tom Baker room of the City/County building for their approval.

DESCRIPTION OF PROJECT: Scope of the project will be Nominating the Provident Building for the National Register of Historic Places. The Provident Building is located at 316 N. 5th St. Bismarck, ND 58506. The project will include documentation and historical research by hiring a consultant to conduct the following:

- site visit,
- photographs,
- archival research.
- Consultant shall provide a physical description, photographs, and history of the property to the State Historic Preservation Review Board in order to attain historical accreditation for the building. SHPO holds quarterly reviews for nominations.
- If necessary the researcher shall present information to County Board including other entities as well as responding to the SHPO Review Board if they request a revision.

A walk through and project explanation meeting will be scheduled for the week of May 9, 2022.
EVALUATION AND SELECTION PROCESS: Consulting firms interested in performing the work shall submit three (3) copies of their proposal to: **COUNTY AUDITOR/TREASURER, 221 NORTH 5TH STREET, BISMARCK, NORTH DAKOTA 58501.** Burleigh County will only consider proposals received on or before 1:30 P.M. (Local Time) on Wednesday May 25, 2022. Late proposals will be considered unresponsive and will not be considered.

Selection will be on the basis of the following criteria:

- Recent, current, and projected workloads of firm’s staff
- Staff experience and technical capabilities
- Related experience and performance on similar projects
- Willingness to meet time and budgetary requirements

RIGHT OF REJECTION: The Board reserves the right to reject any and all proposals; to waive technicalities or to accept such as may be determined to be in the best interest of the County.

DISCLOSURE OF PROPOSAL: The contents of all proposals will be subject to the Open Records Law and may be open to inspection by interested parties. Any information included in the proposal that the proposing party believes to be a trade secret or proprietary information must be clearly identified in the proposal. Any identified information recognized as such and protected by law may be exempt from disclosure.

REQUEST FOR PROPOSAL INFORMATION AND QUESTION: Questions regarding the Request for Proposal should be directed to Leo Vetter Burleigh County Auditor/Treasurer, 221 North 5th Street, Bismarck, ND 58501, telephone (701) 222-6718.

BY ORDER OF THE BOARD OF COMMISSIONERS
BURLEIGH COUNTY, NORTH DAKOTA
This 21st day of April, 2022
LEO VETTER,
Burleigh County Auditor/Treasurer
4/25, 5/2 & 9 - 45728

INVITATION FOR BID

BUILDING REMODEL
Buildings 2280-90 and 5220-30,
Camp Gilbert C. Grafton, Devils Lake,
North Dakota

IFB22-12, IFB22-13, IFB22-14, IFB22-15
An electronic bid depository will be utilized for bidding. The first step in the process is to create an account at bidexpress.com.

REGISTRATION INSTRUCTIONS:
1. <https://bidexpress.com>
2. In the upper right hand corner, Click the “Register” button
3. Complete “My Info”
4. Click “Register” button

You may download project specifications and plans from the electronic bid depository after emailing a copy of your North Dakota Contractor’s license to ng.nd.ndamg.list.dfe-contract-managemen@army.mil. Your request must include contact information which includes your name, business name, address and telephone number.

The closing date for submission of bids is Wednesday, May 18, 2022 at 2:00 p.m. (cst). The electronic bid depository locks promptly at 2:00 p.m. (cst) and will not accept late bids. Bidders must begin the electronic submission process well in advance of the Bid Response deadline to allow for transmission and resolution of any technical difficulties. Be advised, the OWNER is not responsible for a Bidder’s failure to timely submit a Bid Response due to any technical difficulties. If you experience technical difficulties, do not contact the OWNER. You must contact the customer service department at Bid Express (888) 352-2439. Be advised, paper, faxed or emailed bids will NOT be accepted by the OWNER. Questions pertaining to the project specifications or drawings must be directed to the project architect, Shultz + Associates Architects, one week prior to the bid opening. Therefore, the deadline for questions is Wednesday, May 11, 2022.

Bidders have the option to bid on General Construction (IFB22-12), Mechanical Construction (IFB22-13), and/or Electrical Construction (IFB22-14). In addition, bidders may choose to submit a bid for Total Combined Construction (single price) for the complete project (IFB22-15). In compliance with NDCC 48-01.2-06, the combined bid (from a single price) will not be accepted unless that bid is lower than the combined total of the lowest responsible, multiple bids for the project.

All modifications to bid prices must be made by the individual bidder, through the utilization of the electronic bid depository at bidexpress.com. The OWNER is not responsible for handling or overseeing last minute modifications to bid prices. Therefore, faxed or emailed modifications to bid prices will NOT be accepted by the OWNER.

Bids will be read aloud via teleconference at 3:00 p.m. (cst) on Wednesday, May 18, 2022. To listen to the bid opening, you must call in using the following ID and PIN Number: 701-333-2840; ID No. 32068#; PIN No. 32068#

In addition to downloading from “Bid Express”, the bidding documents are on file at plan rooms and builder’s exchanges in the following North Dakota locations: Bismarck, Dickinson, Fargo, Grand Forks, Mandan and Minot, as well as Rapid City, SD and Minneapolis, MN.

IMPORTANT: Davis-Bacon Wage Rates are required for this project.

Each bid must be accompanied by a bidder’s bond made payable to The Adjutant General, State of North Dakota, and executed by the bidder as principle and by a surety company authorized to conduct business in North Dakota, in a sum equal to five percent (5%) of the bidder’s highest total bid combination, including all add alternates to the bid items; conditioned that if the bid is accepted and the contract awarded, the bidder within ten (10) business days after notice of such award, will effect and execute a contract in accordance with the terms of their bid and provide payment and performance bonds as required by North Dakota laws and regulations. A template entitled “AIA Document A310, Bid Bond”, is provided within the electronic project manual and should be used to execute the bid guarantee.

In compliance with Section 43-07-12 of the North Dakota Century Code, each contractor submitting a bid must upload a copy of their North Dakota Contractor’s License or certificate of renewal issued by the ND Secretary of State. Contractors must be licensed for the highest amount of their total bid combination including add alternates; and their ND Contractor’s License must have been in effect at least ten (10) days prior to the date of the bid opening.

No bid will be read or considered which does not fully comply with the requirement herein for a bid bond and a ND Contractor’s License. Both documents must be uploaded to “Bid Express” as attachments to your bid. A Certificate of Good Standing will NOT be accepted in lieu of a North Dakota Contractor’s

License. No exceptions will be made to deficient bids.

The OWNER reserves the right to hold all legitimate bids for a period of thirty (30) days following the date fixed for the bid opening. It is the intent of the OWNER to award a contract to the lowest and best bidder. The OWNER further reserves the right to reject any and all bids and to waive irregularities, and shall incur no legal liability for the State of North Dakota for the payment of any funds until the contract is awarded and approved by the proper authorities.

In compliance with Section 48-01.2-10 of the North Dakota Century Code, the successful bidder (awardee) shall be required to furnish payment and performance bonds covering the faithful performance of the contract award and the payment of all obligations thereunder, and all additional obligations required by the laws of the State of North Dakota. Each payment and performance bond shall be in an amount equal to the full amount of the contract award. Questions may be directed to the Office of the Adjutant General, Contract Management Branch, Bismarck, North Dakota, Telephone (701) 333-2068.

DATED: 25 April 2022
OFFICE OF THE ADJUTANT GENERAL,
Bismarck, North Dakota
By: /s/ JACKIE A. HUBER, Brigadier General, NDNG,
Deputy Adjutant General, Contracting Officer

The Board of City Commissioners of the City of Bismarck will receive sealed bids for the construction of storm sewer, asphaltic concrete and related items in Street Improvement District Number Five Hundred Sixty-Six (566). All bids will be submitted to the City Administrator by 3:00 p.m. Monday, May 9, 2022. Such work to be completed according to the schedule, plans and specifications on file in the Office of the City Administrator. Bids will be opened at 4:00 p.m., Monday, May 9, 2022, in the Office of City Administration.

The proposals must be mailed to or deposited with the City Administrator and shall be sealed and endorsed “Proposal for Street Improvement District Number Five Hundred Sixty-Six (566).” The contractor shall include a copy of his license or renewal thereof enclosed in the required bid bond envelope as required pursuant to Section 43-07-12 of the North Dakota Century Code, as amended. Complete digital project bidding documents are available at www.bismarcknd.gov or www.questcdn.com. You may download the digital plan documents for \$75.00 by inputting Quest project #8169553 on the website’s Project Search page. Contact questcdn.com at 952-233-1632 or info@questcdn.com for assistance in free membership registration, downloading, and working with this digital project information. An optional paper set of project documents is also available for a nonrefundable price of \$150.00 per set, which includes applicable sales tax and shipping. Please make your check for a paper set payable to the City of Bismarck and send it to the City of Bismarck Engineering Department, P.O. Box 5503, Bismarck, North Dakota 58506-5503, stating the project number and if you want to pick it up or to be mailed. Please contact us at 701-355-1505 if you have any questions. The basis of award shall be the lowest and best total bid for the unit(s). Bidders shall balance their bids accordingly.

Bids shall be made on the basis of cash payment for the work to be done. All work under this advertisement shall be started on a date to be specified in a written order from the Board of City Commissioners. Work shall consist of approximately 5 inlets, 450 LF of storm sewer, 3 manholes, 1,900 tons blended base, 5,700 LF of curb and gutter, 2,200 tons of AC superpave, 9,600 SY of seal coat, and related items.

Each bid shall be accompanied by a separate envelope containing a bidder’s bond in the amount of five percent (5%) of the amount of the bid as required by Section 48-01.2, North Dakota Century Code, as amended, and executed as provided by law. The bid bond shall be conditioned that if the principal’s bid is accepted and a contract is awarded, the principal shall execute the contract within ten days of receipt of the notice of award. The Board of City Commissioners reserves the right to hold all bids for a period of thirty (30) days after the date fixed for the opening thereof and reject any or all bids and to waive irregularities whenever it is for the best interest of the City of Bismarck.

The City of Bismarck is committed to providing non-discriminatory service. No person shall, on the basis of a person’s nation origin, race, color, disability, sex, age and/or income status, be excluded from participation or be subjected to discrimination or harassment by the City of Bismarck or any of its locations. The City of Bismarck will consider every request for reasonable accommodation to provide:

- an accessible meeting facility or other accommodation for people with disabilities,
- language interpretation for people with limited English proficiency (LEP), and
- translations of written material necessary to access City of Bismarck programs and information.

Appropriate provisions will be considered when the City of Bismarck is notified at least 10 days prior to the meeting date or the date the written material translation is needed.

To request accommodations, contact the City of Bismarck Title VI and ADA Coordinator, at 701-355-1336. TTY users

may use Relay North Dakota at 711 or 1-800-366-6888.

Complete digital project bidding documents are available at www.bismarcknd.gov or www.questcdn.com. You may download the digital plan documents for \$75.00 by inputting Quest project #8169556 on the website’s Project Search page. Contact questcdn.com at 952-233-1632 or info@questcdn.com for assistance in free membership registration, downloading, and working with this digital project information. An optional paper set of project documents is also available for a nonrefundable price of \$150.00 per set, which includes applicable sales tax and shipping. Please make your check for a paper set payable to the City of Bismarck and send it to the City of Bismarck Engineering Department, P.O. Box 5503, Bismarck, North Dakota 58506-5503, stating the project number and if you want to pick it up or to be mailed. Please contact us at 701-355-1505 if you have any questions.

The basis of award shall be the lowest and best total bid for the unit(s). Bidders shall balance their bids accordingly. Bids shall be made on the basis of cash payment for the work to be done. All work under this advertisement shall be started on a date to be specified in a written order from the Board of City Commissioners. Work shall consist of approximately 8 inlets, 1,400 LF of storm sewer, 6 manholes, 2,000 CY of blended base, 5,300 LF of curb and gutter, 2,200 tons of AC superpave, 10,000 SY of seal coat, and related items.

Each bid shall be accompanied by a separate envelope containing a bidder’s bond in the amount of five percent (5%) of the amount of the bid as required by Section 48-01.2, North Dakota Century Code, as amended, and executed as provided by law. The bid bond shall be conditioned that if the principal’s bid is accepted and a contract is awarded, the principal shall execute the contract within ten days of receipt of the notice of award. The Board of City Commissioners reserves the right to hold all bids for a period of thirty (30) days after the date fixed for the opening thereof and reject any or all bids and to waive irregularities whenever it is for the best interest of the City of Bismarck.

The City of Bismarck is committed to providing non-discriminatory service. No person shall, on the basis of a person’s nation origin, race, color, disability, sex, age and/or income status, be excluded from participation or be subjected to discrimination or harassment by the City of Bismarck or any of its locations. The City of Bismarck will consider every request for reasonable accommodation to provide:

- an accessible meeting facility or other accommodation for people with disabilities,
- language interpretation for people with limited English proficiency (LEP), and
- translations of written material necessary to access City of Bismarck programs and information.

Appropriate provisions will be considered when the City of Bismarck is notified at least 10 days prior to the meeting date or the date the written material translation is needed.

To request accommodations, contact the City of Bismarck Title VI and ADA Coordinator, at 701-355-1336. TTY users may use Relay North Dakota at 711 or 1-800-366-6888.
CITY OF BISMARCK
Keith J. Hunke
City Administrator
Dated this 20th day of April, 2022.

PUBLIC NOTICES

Riverdale City Council Meeting

April 11, 2022

The regular Riverdale City Council meeting of April 11, 2022 was called to order at 6:00 PM by President Orth.

Present: Jerry Orth, Garth Zimbelman, Dick Cheatley, Jonna Taylor and Auditor Del Kolke

Taylor moved to approve the March 14, 2022 meeting minutes. Cheatley seconded. Motion carried.

Taylor moved to approve the bills. Zimbelman seconded. Motion carried.

Taylor moved to approve the agenda. Cheatley seconded. Motion carried.

Guests:

City engineer, AJ Tuck, presented engineering services proposal for Riverdale raw water supply, gate valve and sanitary sewer improvements project. Cheatley moved to table action on the proposal until a special meeting to be held Monday, April 25 at 6:00 PM. Taylor seconded. Motion carried.

Brenda Beran, Women's Club representative, requested the use of the City Plaza area for their second annual vendor show. Taylor moved to grant permission for this event to be held Saturday, July 30 from 10:00 – 3:00. Zimbelman seconded. Auditor to research the option of sampling and selling of wine by Wolf Creek Winery.

Morning Star Campground manager, Terry Morast, asked for clarification of burn ban language. Open fires are prohibited when fire danger index is very high (orange), extreme (red) or a red flag warning has been declared. Manager will check level daily and change sign to reflect the current status. A get-together of campers will be held Saturday, July 9 at the campground gazebo. Taylor moved to pay Terry Morast \$15.00/hour to mow Morning Star Campground for the 2022 camping season. Cheatley seconded. Motion carried.

Old Business:

Taylor moved to approve a 5% salary increase for city employees retroactive to January 1, 2022. Future raises will be handled at budget time. Zimbelman seconded. Roll Call: Zimbelman aye, Cheatley aye, Taylor aye. Motion carried.

New Business:

Taylor moved to approve gaming site authorizations for Garrison Area Improvement Association to conduct games of chance at Knights Bar & Grill and Spillway Coffee House from July 1, 2022 – June 30, 2023. Cheatley seconded. Motion carried.

Taylor moved to approve Building Permit No. 22-2 for construction of a garage on Lot 2 Block 6 Original Townsite. Zimbelman seconded. Motion carried.

Cheatley moved to renew the McLean Mercer Regional Library lease for a two (2) year period beginning July 15, 2022 through July 14, 2024 with no changes to the remaining terms. Zimbelman seconded. Motion carried.

Reports:

Fire Dept. responded to a carbon monoxide alarm at a residence. Brush truck was recently repaired.

A drawing for the order of candidate's names on the ballot was conducted. Council: Jonna Taylor, Mike Dirk, Dave Fryda. Park Board: Kevin Docket, Gary Nordstrom. Final audit report was received from Brady Martz for the 2020 fiscal year. City hall will be closed April 15-19.

Zimbelman reported a brief power outage due to a maintenance item on the 13.8 KV line. He apprised council of a conference call the auditor had with WAPA and MRES pertaining to our switchyard connection. Continued progress of this project is expected.

Cheatley indicated turbidity meters and possibly others at the water treatment facility will need to be replaced at an estimated cost of \$13,000 - \$15,000.

Next meeting is scheduled for Monday, May 9 at 6:00 PM. Meeting adjourned at 7:15 PM.

Turtle Lake-Mercer School Meeting

March 14, 2022

President Britton called the regular meeting of the Turtle Lake-Mercer School Board to order at 7:00 P.M. in the Conference Room on Monday, March 14, 2022.

Directors present in conference room: Fast, O'Shea and Ruffo. Ravnaas and Freeman

Via Conference Call: Ravnaas and Freeman

Superintendent: Sheila Schlafmann

Principal: Steven Heyd

Business Manager: Susan Davis.

Guests: Alyssa Meier

Fast moved to approve the agenda as presented, Ruffo seconded the motion. Motion Unanimously Carried.

Committee Reports

CMC Co-op Meeting-Thursday, March 22nd @ 7:00 PM in Underwood.

CMC Athletic Director, Superintendents from McClusky, Turtle Lake-Mercer and Underwood met and finalized the agenda.

Administration Reports

a) Athletic Director Report-No report at this time.

b) Principal's Report

P-T Conferences are tonight – 3:30 pm to 9:30 pm.

The Book Fair concludes today (Monday, March 14) after a week of sales. As of Wednesday morning, Mrs. Voth reported we had close to \$850 in book sales. Whatever money is raised is reinvested in additional library books. Thank you to Mrs. Voth for her hard work!

ACT exam were administered to juniors March 9, and we should hear back with results in a few weeks.

Last week Mr. Buchholz attended Lincoln Electric Education Partner Schools Start (LEEPSStart) Train-The-Trainer program in Cleveland, OH. This trip was facilitated by the ND Ag Department and funded by a Lincoln Electric Corp. He was the only candidate to represent North Dakota. He is now accredited to issue certifications to our students through the National Coalition of Certification Centers which he will integrate into curriculum as soon as he can allocate funds for the program's subscription fee. More information can be found at <https://www.lincolnelectric.com/en/education/training-programs/educators/leeps-program/leepsstart>.

Scheduling discussions are almost complete. We have just a couple of students left to schedule. As for FACS, it looks like we may be broadcasting to other schools again

North Dakota State Assessments will be held March 31-April 26 for English Language Arts in Grades 3, 4, 5, 6, 7, 8; Math in Grades 3, 4, 5, 6, 7, 8 (No grade 10 ELA/Math if they will take ACT in Grade 11, which is what will happen here); and Science in Grades 4, 8, and 10. Teachers will have a certification session on March 28 to learn how to proctor exams.

Graduation plans are underway! Class motto: Life's a garden, dig it! Class flower: sunflower. Class Colors: White and Gold. Valedictorian: Amy Klain. Salutatorian: Rhea Laib. Class Advisor: Diane Cullum.

Baccalaureate Service: 7 p.m., Sunday, May 15, Trinity Lutheran

Church, Turtle Lake

c) Superintendent Report

CREA was here on March 9th for our Cross-Pollinated groups

Next time they are here is April 13th

E-Rate Form 471 has been submitted

State bandwidth payment of about \$20,000 – without completion of this form TL-M would have to pay this for internet

Spring Sports

Track – began March 10th – 9 students

Melora Buchholz is coaching

Baseball – begins March 21st – 7 boys

Alex Quintane and Hannah Butler are coaching

Softball – begins March 21st – 10 girls

Heather Kramer is coaching

Elementary basketball (5th/6th) – 12 boys

Joi Anderson and Paul Buchholz are coaching

Elementary volleyball – begins March 21st

Chelsea Laswell and Kadence Reiser are coaching

Boys Golf – begins April 11th – 1 boy

Samantha Slavik is coaching

TL-M Speech Meet – Saturday, March 26th

Prom – Saturday, April 2nd

Spring Concert – Thursday, April 21st

Music Trip – April 27th – May 1st

Patty Roth – Tree donation in memory of her brother

Positive Reflection/Sharing:

Thank you to Sandy Tomlinson for her years of service in the kitchen

Lesley Rhoads' last day is April 1st, thank you for being a paraprofessional at TL-M

Congratulations to all of the 5th – 8th graders who performed at the McLean County Music Festival in Washburn – you sounded great!

Congratulations to the TL-M FFA and FFA Alumni for another successful competition – it was well attended even with the icy road.

Old Business:

NOTICE OF INTENT TO AMEND THE STATE IMPLEMENTATION PLAN FOR AIR POLLUTION CONTROL

Relating to the Regional Haze Rule

North Dakota Department of Environmental Quality (“Department”)

will hold an in-person public hearing to address proposed changes to the State Implementation Plan (SIP) for the Control of Air Pollution for the State of North Dakota which addresses Regional Haze (RH) in the Federal Class I areas.

Normandy Building
4201 Normandy Street
(Room 223)
Bismarck, ND
May 31, 2022
9:00 a.m. CDT

For those unable to attend in-person, a virtual listening option has been made available on the Department's Regional Haze webpage: <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>. A copy of the proposed RH SIP revision and supporting documentation may be accessed at the above link. A copy of the proposed RH SIP revision may also be obtained by writing to the North Dakota Department of Environmental Quality, Division of Air Quality, 4201 Normandy Street, Bismarck, North Dakota 58503 or calling (701)328-5188. Written comments may be submitted to the above address on or before June 1, 2022. The RH SIP revision addresses the requirements to show reasonable progress to reduce regional haze (visibility impairment) in Theodore Roosevelt National Park (TRNP) and Lostwood Wilderness Area (LWA). The RH SIP revision includes a Permit to Construct for Coal Creek Station which establishes a limit of nitrogen oxides intended to improve visibility conditions in TRNP and LWA.

The National Park Service is the Federal Land Manager for TRNP and provided comments on the draft RH SIP revision. The U.S. Fish and Wildlife Service is the Federal Land Manager for LWA and did not provide comment on the draft RH SIP revision. The Department also received comments from the U.S. Forest Service on the draft RH SIP revision. The comments received can be found in Appendix D.2 of the RH SIP revision. These comments may be accessed at the website listed above or by contacting the Department. The Department has provided a written response to these comments in Appendix D.2.

If you plan to attend the hearing and will need special facilities or assistance relating to a disability, please contact the Department of Environmental Quality at the above address at least seven days prior to the hearing.

Dated this 18th day of April 2022
James L. Semerad, Director
Division of Air Quality

D.3.f – Hearing Transcript

Regional Haze Hearing Transcript

Jim Semerad: Good morning, everybody. Welcome to the North Dakota Department of Environmental Quality Office Building. My name again is Jim Semerad and I will be acting as hearing officer for this public hearing. It is approximately 9:17 a.m., May 31st, 2022, in the NDDEQ office building. So at this time I open this public hearing. This public hearing has been called for the purpose of allowing all interested individuals an opportunity to submit information concerning the Department's draft state implementation plan revision addressing regional haze. Information gathered at the hearing will be transmitted to the Department for deliberation and final decision making. The Department will not be responding to comments at this hearing. Comments received at the hearing will be considered with any written comments that are received, and the Department will present its consideration of all comments in writing. You may request a copy of the written responses and one will be provided to you. This hearing is being recorded and we ask everyone offering testimony to use the podium so that the tape will be of good quality for transcribing purposes. Please identify yourself for the record before you speak. If you have a prepared statement, a written copy of the statement is much appreciated. A registration sheet has been placed next to the door and I ask everyone present to please sign in before they leave. At this point, I open the hearing for comments.

Jonathan Fortner: For the record, Jonathan Fortner representing the Lignite Energy Council. Director Glatt and members of the Department of Environmental Quality. On behalf of the members of the Lignite Energy Council, I'm providing a summary of the written comments that we will submit tomorrow, which are in support of DEQ's Draft State Implementation Plan for the second decadal review of the Environmental Protection Agency's Regional Haze program. LEC supports the draft SIP because it represents the culmination of immense effort to exhaustively review all relevant information, comprehensively consider available policy options, and thoughtfully design a reasonable plan to reduce visible haze in a manner consistent with all federal and state laws. The Lignite Energy Council represents the regional lignite industry in North Dakota, which is an \$18 billion industry critical to the economy of the upper Midwest, and adds \$5.7 billion in annual economic impact to the region and provides 14,000 direct and indirect jobs. LEC has advocated for its members since 1974 to protect, maintain and enhance development of our region's abundant lignite resource. LEC is also committed to the environmental stewardship and understands the importance of protecting North Dakota's natural beauty. North Dakota has some of the best air quality in the country. It is only one of four states that has never violated health-based standards for ambient air established by the Environmental Protection Agency. Let me repeat that it is one of only four states that has never violated health-based standards for ambient air established by the EPA. That success is a tribute to the state's sound policies, effective laws, and a firm commitment by industry to minimize environmental impacts. This is remarkable considering the significant sources of air emissions impacting North Dakota that are beyond its control, including frequent wildfires to the West and uncontrolled Canadian emission sources to the north. Despite those headwinds, the state of North Dakota, under the able leadership of DEQ, has always maintained excellent air quality. In fact, due to the measures that DEQ adopted in its first round haze plan and the additional requirements and now proposes for its second round plan, the visibility range in the state is projected to achieve by 2028 nearly half of its goal of eliminating all manmade visibility impairment by 2064, which is well ahead of the schedule that is set by EPA. This extraordinary progress is

primarily the result of significant emission reductions achieved by the lignite powered electric generating units over the past decade, including reductions that have already been made and included in the DEQ's Original Regional Haze SIP, as well as the new reductions considered in the draft SIP for round two. Through installing advanced emission control equipment with an estimated cost of over \$2 billion, emissions from coal fired egu's have dropped precipitously while improving visibility in North Dakota's already healthy air. In the draft SIP, DEQ appropriately considered highly detailed reports from numerous individual emission source owners regarding the potential cost of imposing additional control measures to further reduce emissions. From those reports, DEQ conducted the four-factor analysis, as required by the Clean Air Act and also EPA regulations, to develop three different sets of control options. Those three scenarios were the subject of extensive study by WRAP, the Western Regional Air Partnership, which is North Dakota's regional planning organization. DEQ then applied its own expertise and independent judgment to reasonably conclude that additional controls beyond those already adopted would not be necessary to make reasonable progress toward EPA's 2064 goal of eliminating anthropogenic visibility impairment. The approach taken by DEQ in the draft SIP is consistent with the mandatory legal requirements of the Clean Air Act and also EPA's regional haze rule. It also follows EPA's non-binding guidance on the development of state regional haze plans. It is also eminently reasonable in that DEQ weighed the costs and the benefits of various policy options based on a thorough analysis of all relevant facts and circumstances, and then reached rational conclusions that are consistent with those facts. Therefore, LEC supports the draft SIP and encourages DEQ to submit it to EPA in a timely fashion. Our written public comments also provide some suggestions to further clarify and strengthen the underlying technical and legal support for the draft SIP. We appreciate this opportunity to provide these comments and look forward to continued engagement with DEQ on our common and interconnected goals of a healthy environment and a healthy economy. Thank you for the opportunity to speak with you today.

Jim Semerad: Thank you for your comments. Next. Thank you.

Prairie Rose Seminole: Good morning. Thank you for the opportunity to provide testimony during this time. My name is Prairie Rose Seminole. I'm a citizen of the three affiliated tribes, the Mandan, Hidatsa, Arikara nations. I live in Hazen North Dakota and have land and livestock across the waters of the Garrison Dam and White Shield, North Dakota. I'm here to testify to and support goals of the Haze Program to reduce pollution that degrades visibility and health at national parks and wilderness areas in North Dakota and neighboring states.

Every day I make an early drive, often through haze, across the dam that flooded the bottom lands of my father's home two generations ago. As I crossed the dark blue waters of Lake Sakakawea, a reservoir formed by the damming of the Missouri River, I can see the layers of lignite coal along the bluffs of the shores and coal debris causing black lined beaches. I make my way through more towns when I pass the small herd of antelope before I turn on to the highway, if I face south at this time I can see the scar into the earth left now from the strip mining coal process. Coal being mined since 1873, 16 years before North Dakota became a state in 1889. I grew up seeing the coal industry. My sister and I, as kids, used to think that magic was happening there with all the lights and clouds coming out, lit up so brightly at night. At the time, being a kid, North Dakota nights in the West were still dark, lit up only by stars, moons and the

coal factory lights. We couldn't even imagine then what kind of damage is happening now from those same magic clouds.

Today, from where I live and across the water, when I'm with my horses, I can see the billowing exhaust from Antelope Valley and Coyote coal stations and Great Plains SynFuels Gas plant polluting my air. They are North Dakota's and some of our nation's biggest national park polluting facilities. It is unconscionable that our state is advancing a haze plan that does nothing to cut the pollution from these facilities and other industries despite clear evidence that they are harmful to me and my family, our livestock and native lands. The peoples of the MHA nation and my family have been stewards of these river valleys and bottom lands for time immemorial and can recall a time of pure waters, clean air, and bountiful lands that may become to only exist in our stories.

The regional haze plan proposed by the State of North Dakota fails to reduce pollution and falls short on the state's obligation to improve air quality not only for our parks, it fails our communities, and our people. According to the National Park Service, air quality has deteriorated in Theodore Roosevelt National Park since 2016. Clear Skies and public health in Longwood Wilderness Area, Badlands Voyageurs, Wind Cave and Isle Royale national parks are being negatively affected by pollution from North Dakota's coal plants, industrial facilities and oil and gas operations. The decrease in air quality in these and other areas of state highlight urgent need for pollution cuts to be integrated into the state's plan. We can do better.

North Dakota Department of Environmental Quality's proposal has concluded that no new reductions in pollution are warranted on some of the nation's most polluting coal plants, right here. If the current plan is finalized, the National Parks Conservation Association estimates that more than 72,000 of preventable tons of SO₂ and NO_x will continue to be released into the air from these and other facilities over the next decade, impacting air and health in my home communities and all of the lands of the Mandan, Hidatsa and Arikara Nation of the Fort Berthold Indian Reservation. Just as the dam took our bottom lands, the state plan continues to exert narrative and action that treat us as expendable peoples. We have to do better. We are citizens of North Dakota and this nation, along with our own. Our lives matter. Our land and our waters matter.

Further, the NPCA's analysis of polluting sources, the electricity sector emits 87% of the state's haze pollution in North Dakota, and in the current haze plan proposal they have not required pollution controls from Coyote Station, Antelope Valley Station, Coal Creek Station, Milton R Young Station, Leland Olds Station, and the R M Heskett Station.

North Dakota Department of Environmental Quality did not require any emission reducing measures from the following major oil and gas facilities the Great Plains, Synfuels Plant, Tioga Gas Plant, Little Knife Gas Plant and the Northern Border Pipeline Compressor Station.

North Dakota has the biggest influence over haze on National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. For North Dakota to fulfill its regional haze obligations under the Clean Air Act, the state must revise its plan by implementing strong and significant emission reducing measures for the six

coal fired power plants where emissions are long overdue to be cleaned up. Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring. Thoroughly assessing and addressing environmental justice impacts as the EPA recommended. If left unchanged, the state's plans will not comply with the Federal Clean Air Act and the United States Environmental Protection Agency's regional haze rule, as it does nothing to limit haze causing air pollution and fails to restore naturally clean air. We need real emission reductions to reduce haze at our public lands and improve public health.

We have an opportunity to achieve a regional haze plan for North Dakota that protects our people, our parks, and our future. This haze plan proposal makes no improvement and we the people, our lands and water will pay over-time. It is time that all decision makers and stakeholders are aware of what is at risk and to be involved with the work at the federal, state and municipal levels to make a bolder plan happen. We can do better. Thank you.

Jim Semerad: Thank you for your comment.

Tracy Potter: Good morning. My name is Tracy Potter, I'm the senator for district 35 in Bismarck, recently appointed. 15 years ago as a freshman state senator, I saw a news report that North Dakota had some of the dirtiest coal plants in America on a per kilowatt basis, at least. But our state health department said we had some of the cleanest air. I didn't want to argue with either President Bush's EPA or the state health Department, but I was concerned about the nature of the pollutants being generated, not carbon dioxide particularly, but harmful emissions like NOx and SO₂, and mercury. Things that are health hazards to those of us living downwind in the Missouri River Valley from the coal plants.

I wanted the legislature to study how to economically reduce those harmful emissions without disrupting energy production. It seemed like a reasonable public policy to reward the industry with tax credits for investments in improving their environmental record. My study did not pass. I could explain why, but there's no reason.

The National Park Service and the Department of Environmental Quality have differing views of the importance of haze and cost effectiveness of reducing haze, whether significantly or incrementally. I'm not about to insert my opinion between the scientists on either side.

My comments today are about valuing costs. DEQ says the potential improvements in visibility are not worth the costs. This is where I think we're missing two important factors. Visibility is only one factor. Virtually invisible particulates in the emissions from coal plants cause human health effects. Mercury is produced when coal is burned. Mercury gets into our bodies when we breathe and when we eat the walleyes in Missouri river. Its health effects are harmful, particularly to the unborn and children, 4 to 5 times more harmful to them than to other people. It causes birth defects. Nitrogen oxide can restrict lung function and is particularly hard on children, the elderly and asthmatics. Sulphur dioxide contributes to acid rain, preterm birth and other impacts on human and animal health. And I want to compliment the industry and the department for its reductions. But we can do better. We can do better.

The second point is about costs. What is the nature of these costs? It would be the cost of creating well-paying jobs and reducing emissions, adding smokestacks, cleaning coal, or finding innovations not yet envisioned. It's not money that's lost or thrown away. It supports our economy. It's money paid to North Dakotans for doing something to improve the health of North Dakotans. Much of it will come back to the state in income and sales tax.

This is a time of remarkable opportunity. State treasuries are overflowing. Revenue collections are hundreds of millions of dollars over projections just this year. Oil prices are higher than projected. It was supposed to be \$50 a barrel. I wrote this this morning I said WTI is \$118 this morning. No, by the time I left home, it was \$119.21. And the tax trigger is being pulled tomorrow, generating hundreds of millions of more dollars. Our Legacy Fund and Common Schools Trust Fund alone hold \$15 billion and keep growing. All the stabilization and rainy-day funds are flush. There has never been a better time to make significant one-time investments in 21st century infrastructure.

So my comment is the state should make these investments in public health whether or not there is a very noticeable effect on Haze. We should pursue a public private partnership to improve our coal plants and reduce flaring in the oilpatch. The state can help industry pay for the investments in improving infrastructure. Give them tax credits for investments required to better our health.

It will require legislative action to do what I suggest, but the public private partnership could begin immediately. The Department of Environmental Quality should meet with the utilities to plan and price improvements to show good faith to the National Park Service, which is so important to North Dakota's tourism industry and to our quality of life. Let's avoid confrontation and work together for a healthier future for our people and our state. Thank you for your consideration of these remarks.

Jim Semerad: Thank you for your comment. Any other comments?

Elizabeth Loos: Good morning. Thank you for the opportunity to speak today. My name is Elizabeth Loos and I'm executive director of Badlands Conservation Alliance. Badlands Conservation Alliance is a non-profit organization based in western North Dakota dedicated to the wide stewardship of public lands, including the approximately 70,000 acres of Theodore Roosevelt National Park. Many of our members are from communities and rural landscapes surrounding the park and hold significant familiarity with these lands and value them for a host of ecological heritage and personal reasons, frequently through multiple generations.

Each year more than a half a million people visit Theodore Roosevelt National Park, which is our state's largest tourist attraction. Sharing our state's wonders not only bolsters our pride and appreciation for these precious landscapes, but it helps sustain gateway towns like Medora and Beach, where small businesses thrive off of the tourism industry. In 2019, park visitors spent \$44.3 million on lodging, restaurants, gas and retail purchases.

North Dakota is special, everyone in this room will agree on that. Our state isn't riddled with the urban congestion of the West Coast or the unbroken sprawl of the East. Looking out over the sweeping vistas of Theodore Roosevelt National Park, it's easy to believe that that view is unchanged from the landscape TR witnessed in 1883. That, however, is far from the truth. Cars, trucks, oil and gas operations, coal fired plants and other industrial sources fill our air with sulfur dioxide and nitrogen oxides, which contribute to regional haze.

The Clean Air Act Regional Haze Rule requires all states, including North Dakota, to do their share by reducing pollution within their borders to help restore clean and clear skies at protected national parks and wilderness areas. It's troubling to us that the state of North Dakota has proposed a regional haze plan that fails to reduce pollution and falls short on the state's obligation to improve air quality for our parks and communities.

North Dakota Department of Environmental Quality selected ten facilities for review of emission reducing measures in this regional haze plan, but despite many opportunities for effective cost controls, concludes that no new reductions in pollution are warranted. Without new controls for the next decade, more than 72,000 tons of sulfur dioxide and nitrogen oxides will be released into the air from polluting facilities.

There are many important issues in this state implementation plan that are beyond my technical expertise and were raised during the Federal Land Manager comment period, but I'd like to briefly highlight two issues of particular concern in this SIP. First is the notion of glide path, which was in the slide, and I'll read from page 12 of the draft SIP. North Dakota is currently projected to meet 2028 visibility goals and is projected to remain on track to meet the 2064 visibility goals, below the adjusted glide path. Continuing to remain below an adjusted glide path and showing improvement on the most impaired days for each planning period will accomplish the 2064 goals. North Dakota has determined that the additional controls evaluated will not have a meaningful impact on the 2028 visibility projections. Therefore, the Department determined that it is not reasonable to require additional controls during this period.

Essentially, the DEQ considers the fact that its class one areas are under their glide paths a valid reason to forgo otherwise cost-effective controls. But under the regional haze rule and as outlined in EPA's clarification memo, one just issued in July of this year, this consideration is specifically prohibited. North Dakota is required to make to impose controls on the sources within our borders.

Second, we're concerned that DEQ fails to consider emissions from oil and gas operations. Oil and gas emissions make a significant contribution to visibility impairment at Theodore Roosevelt National Park, and they are projected to increase over this planning period, which is acknowledged in the SIP. While no single well site has a significant footprint, the cumulative emissions from all well sites combined are substantial, which is also acknowledged in the SIP. So we encourage the state to adopt rules to limit emissions from individual well sites with the cumulative emissions in mind, which has been done in other states and is certainly possible.

The bottom line is that this regional haze plan fails to reduce pollution and meet the standards set by the Regional Haze Rule and the Clean Air Act. North Dakota can and should do better. Thank you.

Jim Semerad: Thank you for your comments. Anyone else wishing to testify. Last chance. Again, I would like to thank everyone for coming both in person and virtual. All information that was gathered at this hearing will be provided to the Department of Environmental Quality, which is the decision-making body. The record will be held open for written comments until June 1, 2022. At this point, I close the hearing on the Department of Environmental Quality's Draft State Implementation Plan Revision for Regional Haze. The hearing is closed at 9:44 a.m.. Again, thank you for coming.

D.3.g – Certificate of Hearing

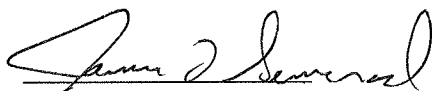

Certification of Public Hearing

Re: Implementation Plan for Control of Air Pollution for the State of North Dakota

Certification:

The undersigned certifies that the public hearing held by the North Dakota Department of Environmental Quality on May 31, 2022, for the purpose of receiving and considering testimony and evidence bearing on the proposed revisions to the Implementation Plan for the Control of Air Pollution for the State of North Dakota was held in accordance with the notice required by Section 51.102 Public Hearings of the Requirements for Preparation, Adoption, and Submittal of Implementation Plans, Code of Federal Regulations, Title 40, Chapter I, Subchapter C, Part 51.

Date: June 2, 2022

Affidavit:

State of North Dakota

County of Burleigh

On the 2nd day of June 2022 before me personally appeared James Semerad, who having been duly sworn, stated that to the best of his knowledge and belief the statements in the foregoing certification are true.

Subscribed and sworn to before me

Jim

Attached is a letter that provides EPA's comments and recommendations on North Dakota's draft SIP for the regional haze second implementation period (2018 to 2028). We have based our comments and recommendations on the positions provided for in the Regional Haze Rule, the 2019 regional haze guidance, and the July 2021 clarifications memo OAR issued.

It may be helpful for your staff to discuss these comments on a call with Region 8 and OAQPS staff. Please let us know if you are interested in such a call.

We appreciate the opportunity to comment on the draft SIP. We recognize the significant efforts made by the North Dakota Division of Air Quality in developing the draft SIP and the Division's commitment to improving air quality and visibility impacts in North Dakota.

Regards

Carl Daly

Dear Mr. Semerad:

Thank you for submitting the draft North Dakota State Implementation Plan for Regional Haze (RH SIP) revision for our review, which we received by email on September 15, 2021. Based on our initial review of the draft RH SIP revision, we are providing the enclosed comments. Please note that this is only an initial review and that we will reach a final conclusion regarding the adequacy of the RH SIP revision only when we act through notice and comment rulemaking.

We appreciate the opportunity to comment on the draft RH SIP revision. If you have any questions, please feel free to contact me or your staff may contact Aaron Worstell at (303) 312-6073 or at worstell.aaron@epa.gov.

Sincerely,

X

Carl Daly
Acting Director
Air and Radiation Division

EPA Comments on the North Dakota State Implementation Plan for Regional Haze (RH SIP) – Draft for Federal Land Manager Review

1. Overall comment on the regional haze “reasonable progress” requirement. The Regional Haze Rule establishes a framework of periodic SIP revisions to implement Congress’ requirement that states’ SIPs include long-term strategies for making reasonable progress towards the national visibility goal. To this end, 40 CFR 51.308(f) requires that each periodic SIP revision contain a strategy for making reasonable progress for the applicable period. The increment of progress that is “reasonable progress” for a given implementation period is determined through the four factors. 40 CFR 51.308(f)(2)(i). EPA has explained that reasonable progress cannot be determined prior to or independently from the analysis of control measures for sources. See 82 FR 3078, 3091/3 (Jan. 10, 2017); *Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period* (July 8, 2021; hereinafter “Clarifications Memo”) at 6.¹ North Dakota must therefore determine what is necessary to make reasonable progress in the second implementation period by using the four factors to analyze control measures for sources. We acknowledge the progress made in the first implementation period, and that ongoing emission trends and anticipated changes in emissions may inform a state’s regional haze planning process. However, these circumstances alone do not satisfy a state’s obligation to include the measures that are necessary to make reasonable progress in its SIP.
2. Overall comment on enforceable measures in SIPs. Section 110(a) of the Clean Air Act (42 USC section 7410(a)) outlines the requirement that SIPs contain enforceable emissions limitations and other control measures, means, or techniques relied on and include a program for the enforcement of the measures. Therefore, any emission limits or control measures ultimately relied on by North Dakota to make reasonable progress must be in the SIP and accompanied by provisions to ensure that the emission limits or other control measures are enforceable. EPA’s *Guidance on Regional Haze State Implementation Plans for the Second Implementation Period* (August 20, 2019; hereinafter “Guidance”) at 42. Also, see 40 CFR 51.308(f)(2). See related comment number 20 below.
3. Section 2.4, *North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs*. North Dakota should clarify whether this section, along with the Weighted Emissions Potential (WEP) and Area of Influence (AOI) products in Appendix C.3, are intended to represent North Dakota’s determination of which Class I areas in other states may be affected by emissions from North Dakota, as is necessary under 40 CFR 51.308(f)(2). In this section, or elsewhere in the SIP, North Dakota should explicitly identify which Class I areas in other states may be affected by emissions from North Dakota, as well as the basis for making that determination. In addition, the determination should be based on the visibility impairment contributed to by all types of anthropogenic sources (such as major and minor stationary sources, mobile sources, and area sources) in the state, not merely large point sources. See Guidance at 8.

¹ “Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period,” *available at* <https://www.epa.gov/visibility/clarifications-regarding-regional-haze-state-implementation-plans-second-implementation>.

4. Section 2.4, *North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs*. Statements in this section appear to conflict with the state's evaluation of the WEP/AOI analysis in Appendix C.3. Specifically, this section states that the impacts from North Dakota sources to Class I areas in other states are "insignificant," while the WEP/AOI results in Appendix C.3, and the state's evaluation of those results, indicate otherwise. For example, as shown Appendix C.3, emissions emanating from North Dakota, and in particular emissions from the EGU and oil and gas sectors, have among the highest potential to impair visibility at Medicine Lake Wilderness Area in Montana.² In fact, in Section 5.1 and Appendix C.3, North Dakota cites these impacts as justifying the state's consideration of additional controls for sources in the EGU and oil gas sectors under four factor analyses. Given the relatively large potential of sources in North Dakota to impair visibility, we recommend that the state reassess whether its emissions affect visibility impairment in Class I areas in other states.
5. Section 2.4, *North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs*. In addition to the WEP/AOI analysis, we recommend that North Dakota consider WRAP's source apportionment analysis (2028OTBa2, low-level) when determining which Class I areas in other states may be affected by emissions from sources in North Dakota under 40 CFR 51.308(f)(2). EPA notes that the WRAP's source apportionment analysis indicates that North Dakota sources, such as those from the EGU and oil and gas sectors, are among the largest contributors to U.S. anthropogenic impairment due to ammonium nitrate and ammonium sulfate in 2028. For example, at Badlands National Park, the contribution to ammonium sulfate light extinction from the EGU sector in North Dakota is the largest for any state-sector in the WRAP region. Similarly, at Badlands National Park, the contribution to ammonium nitrate light extinction from the oil and gas sector in North Dakota is the largest for any state-sector in the WRAP region.³ Moreover, for all anthropogenic source categories combined, North Dakota contributes more to ammonium nitrate and ammonium sulfate light extinction at Badlands National Park than any other state in the WRAP region. Given these relatively large contributions from sources in North Dakota, we recommend that the state reassess whether its emissions affect visibility impairment in Class I areas in other states.
6. Section 3.1, *Visibility Summary*. Based on source apportionment modeling, North Dakota presents the state's percentage contribution to *total* visibility impairment from ammonium nitrate and ammonium sulfate to Class I areas within the State (as light extinction). Among other things, as presented the total visibility impairment includes that from international emissions, natural emissions, and Rayleigh background. The national goal of the visibility protection program is to prevent any future and remedy any existing *anthropogenic* visibility impairment in Class I areas. Clean Air Act section 169A(a). The state should focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable progress towards the national visibility goal. We acknowledge that North Dakota cannot directly control emissions from international anthropogenic sources. Nonetheless, the state can focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable progress towards the national visibility goal. Therefore, North Dakota should present the state's percentage contribution to total anthropogenic

² Appendix C.3, Figures 13 through 15.

³ Based on WRAP state-sector source apportionment results available in the Technical Support System at <https://views.cira.colostate.edu/tssv2/Express/ModelingTools.aspx>

and/or U.S. anthropogenic impairment. Comparing the contribution from North Dakota sources to the contribution from all sources (including natural and Rayleigh), rather than that from anthropogenic sources, has the effect of understating the percent contribution by North Dakota to sources of visibility impairment that can be controlled.

7. Section 4.2.1.1.1, *SO₂ Emissions from North Dakota Coal Fired EGUs* and Section 4.2.1.1.2 *NO_x Emissions from North Dakota Coal Fired EGUs*. Tables 22 and 24, for SO₂ and NO_x, respectively, provide a comparison between the representative annual baseline emission rate (lb/MMBtu) and the most stringent existing or proposed emission limit for selected EGUs. These comparisons should prove useful in relation to our comments below regarding 1) whether existing measures are necessary to make reasonable progress and need to be included in the long-term strategy, and 2) emission limit tightening. For EGUs with only a 3-hour rolling average emission limit for SO₂ (which is generally much higher than the indicated annual performance rate), we recommend that the state consider adding a 30-day rolling average emission limit that is either reflective of any new controls ultimately selected through the SIP development process, or at a minimum, that are commensurate with the performance of existing controls. In addition, we recommend, that to the extent possible, North Dakota provide a similar table for selected non-EGU sources.
8. Section, 5.1.2 *Determination of Subject Facilities*. In the Q/d analysis used to select sources for four factor analysis, North Dakota uses average annual emissions from 2012 through 2016. To meet the requirements of 40 CFR 51.308(f)(2)(iii) of the regional haze rule, “emissions information must include, but need not be limited to, information on emissions in a year at least as recent as the most recent year for which the state has submitted emission inventory information to EPA as part of the triennial National Emissions Inventory process.” Guidance at 17 and 18. Accordingly, we recommend that the state assess whether using more recent emissions data (2017 or newer data) would alter which sources are selected for four factor analysis.

Additionally, North Dakota states that it used a Q/d of 10 when determining which sources would be selected for a four-factor analysis. However, North Dakota does not explain why that threshold was selected, how the threshold was selected, or how the threshold will ensure that a reasonable set of sources are selected for four factor analyses. EPA suggests that North Dakota include additional explanation as to how their source-selection will result in fulfillment of its reasonable progress requirements.

9. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources*. In several places, North Dakota states that the Class I areas in North Dakota are under the projected 2028 adjusted glidepath. We recommend that North Dakota refrain from relying on the fact that the Class I areas remain below the adjusted glidepath projected to 2028 to determine whether additional controls are necessary for reasonable progress in the second planning period. We have stated repeatedly that the uniform rate of progress or glidepath is not a “safe harbor” and that Class I areas’ position vis-à-vis the glidepath cannot be a basis for justifying a particular set of controls or decision to not require controls. Instead, the uniform rate of progress is a planning metric used to gauge the amount of progress made thus far and the amount left to make. Because the uniform rate of progress is not based on the four statutory factors, it cannot be used to determine whether the amount of progress made in any particular implementation period is reasonable. See Guidance at 50 and Clarifications Memo at 15. While we recognize the progress North Dakota has made to date, we recommend that North Dakota determine reasonable progress through application of the four statutory factors to sources and to seek meaningful reductions in visibility impairing

pollutants in the second planning period to build on the progress North Dakota has already achieved and continue progress towards natural visibility conditions for the two Class I areas within North Dakota and out-of-state Class I areas affected by emissions from North Dakota.

10. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources*. Pursuant to 40 CFR 51.308(f)(2)(i), North Dakota must include in its submission an evaluation of the four-factors when determining emission reduction measures to be included in its long-term strategy. However, North Dakota only included the conclusions of the four factor analyses in the SIP submission and not the four-factor analyses themselves, which were in an appendix. While the state may choose to summarize the analyses in the SIP submission, we recommend that the summary provide enough detail to show how each of the four individual factors were considered for each source in order to ensure reasonable determinations were made.

After a reasonable analysis of the four factors, if North Dakota determines, for a particular source, that no additional (i.e., new) measures are necessary to make reasonable progress, the state must determine whether the source's existing measures are necessary to make reasonable progress. See section 4 (pages 8 – 12) of the Clarifications Memo for information on determining when a source's existing measures are necessary to make reasonable progress. Generally, a source's existing measures are needed to prevent future emission increases and are thus needed to make reasonable progress. If North Dakota concludes that the existing controls at a selected source are necessary to make reasonable progress, North Dakota must adopt emissions limits based on those controls as part of its long-term strategy for the second planning period and include those limits in its SIP (to the extent they do not already exist in the SIP). Alternatively, if North Dakota can demonstrate that the source will continue to implement its existing measures and will not increase its emission rate and provide appropriate documentation to support its demonstration, it may be reasonable for the state to conclude that the existing controls are not necessary to make reasonable progress. In such case, the emission limits may not need to be adopted into the long-term strategy. As the SIP is currently drafted, it is unclear what measures the state considers to be necessary for reasonable progress and thus a part of the long-term strategy and which measures the state is merely discussing in its SIP narrative as part of its consideration of ongoing air pollution control programs. Therefore, we recommend that North Dakota make clear its determination for each source and explain whether it is including either existing or new emission limits for each source in the long-term strategy and SIP (or whether emission limits already exist in the SIP). See Guidance at 43; Clarifications Memo at 8-9.

11. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources*. Throughout, we recommend that for each of the selected sources the state consider whether a source can achieve or is already achieving a lower emission rate using its existing measures. If a source is operating or is capable of operating at a lower emission rate than assumed either (1) as the basis for not conducting a full four-factor analysis or (2) as the baseline for four-factor analysis, that lower rate should be analyzed as a potential control measure. See Clarifications Memo at 5, 7. For example, at Antelope Valley Station Units 1 and 2, where the existing NO_x emission limit is 0.17 lb/MMBtu (30-day rolling average) at each unit, and where each unit has been operating consistently below 0.13 lb/MMBtu (monthly) for many years, we recommend that the state consider an emission limit commensurate with the actual operation and emissions of the source with existing measures. (The example is only in the instance where North Dakota ultimately elects not to require new or upgraded controls at Antelope Valley Station.) This is sometimes referred to as “emission limit tightening.”

12. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources*. North Dakota rejects additional controls for selected sources, at least in part, on the basis that the state deems the modeled visibility improvements to “not be considered significant.” EPA has explained that states choosing to consider visibility benefits as an optional additional factor should not use visibility to summarily dismiss cost-effective potential controls, and that a state that has identified cost-effective controls but rejects most or all of them based on visibility benefits is likely to be improperly using visibility as an additional factor. Clarifications Memo at 13. In this case, it appears that North Dakota is rejecting all additional controls at its selected sources, regardless of whether they are cost effective, because the Class I areas are below their uniform rates of progress and the potential emission reductions do not have a meaningful impact on visibility. These are generally inappropriate bases on which to make reasonable progress determinations for sources. Please see pages 12 and 13 of the Clarifications Memo for generally permissible ways to consider visibility in a four-factor analysis and control determination. We recommend that the state reconsider its four-factor analysis accordingly.

Relatedly, we note that whether a particular visibility impact is “meaningful” should be assessed in the context of an individual state’s contribution to impairment, as opposed to total impairment at a Class I area. Clarifications Memo at 14. As many of the largest individual visibility impairing sources have either already been controlled (under the RHR or other CAA or state programs) or have retired, the remaining individual sources are often smaller and better controlled, with each source making relatively smaller contributions to a class I area as a proportion of total impairment. This does not mean, however, that such sources need not be controlled. To the contrary, the evaluation and control of such smaller sources may be necessary to achieve the national goal of the prevention of any future, and the remedying of any existing, anthropogenic impairment of visibility in class I areas. Also, North Dakota states that the visibility improvements “are smaller than what is perceptible by an unaided human eye.” Visibility improvements need not be perceptible in order to justify additional controls. Guidance at 38 and Clarifications Memo at 14.

Furthermore, we caution North Dakota that it should not reject cost-effective controls and otherwise reasonable controls merely because some portion of visibility-impairing pollutants come from international sources. The national goal of the visibility protection program is to prevent any future and remedy any existing anthropogenic visibility impairment in Class I areas. Clean Air Act section 169A(a). We acknowledge that North Dakota cannot directly control emissions from international anthropogenic sources. Nonetheless, the state can focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable progress towards the national visibility goal.

13. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources* and Appendix A. Throughout, we recommend that the costs of compliance be calculated consistent with the methods set forth in EPA’s Control Cost Manual. We recommend that if North Dakota deviates from these methods that North Dakota explain, document, and provide a technical basis on how its alternative approach is appropriate. Guidance at 31.
14. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources* and Appendix A. Throughout, where a firm-specific interest rate is available, we recommend that it be used to assess

costs. We also recommend that the basis for any firm-specific interest rate be well-documented and justified. For example, where applicable (e.g., for a regulated electric utility), North Dakota may choose to justify the rate based on the cost of capital, including from both equity and debt, approved for a particular company by the North Dakota Public Service Commission. If a firm-specific interest rate is not available, then the bank prime rate (currently 3.25%⁴) can be an appropriate estimate of the interest rate. These recommendations are consistent with EPA's Control Cost Manual at Chapter 2, page 15.

15. Section 5.2, §51.308(f)(2)(i) - *Four Factors Analyses for Point Sources* and Appendix A. Throughout, we recommend that the equipment life used to calculate costs for each control technology option, unless constrained by an enforceable retirement date for the source, be consistent with that found in the respective chapter of EPA's Control Cost Manual. Any deviations from EPA's Control Cost Manual need to be documented with an appropriate rationale provided as the basis for the deviation. Notably, the state's four factor analyses often use an equipment life of 20 years for selective catalytic reduction (NO_x) and wet and dry scrubbers, while the Control Cost Manual recommends an equipment life of 30 years. See Guidance at 33-34.
16. Section 5.2.1, *Otter Tail Power Company – Coyote Station*. Through the four factor analysis, North Dakota identifies cost-effective controls at Coyote Station for inclusion in the 2028 potential additional control modeling scenarios (PAC1 and PAC2). North Dakota noted that these control options are “in line with the control technologies and emissions rates of similar EGUs which were subject to the BART requirements.” For the single unit at the facility, the cost-effective SO₂ controls include 1) replacing the existing SO₂ absorber module that would reduce SO₂ by 11,600 tons per year at a cost of \$1,800 per ton of SO₂ reduced (PAC1 model scenario), and 2) flue gas desulfurization (FGD) efficiency improvements that would reduce SO₂ by 5,300 tons per year at a cost-effectiveness of \$400 per ton of SO₂ reduced (PAC2 modeling scenario). For NO_x, the cost-effective control options include selective noncatalytic reduction (SNCR) that would reduce NO_x by 3,000 tons per year at a cost-effectiveness of \$1,700 per ton of NO_x reduced (PAC 1 model scenario). North Dakota then rejects these cost-effective controls because 1) the “modeling has indicated no expected significant change in visibility” (for either PAC1 or PAC2), and 2) the Class I areas in North Dakota are projected to achieve the URP. However, as noted in previous comments, North Dakota is likely to be improperly using the non-statutory factor of visibility as an additional factor to negate the four factor requirements. In addition, as noted in other comments, being below the glidepath is not an appropriate basis for rejecting cost-effective controls. Accordingly, using the four statutory factors, North Dakota should reassess its determination that these cost-effective controls are not warranted for Coyote Station.
17. Section 5.2.2, *Basin Electric Power Cooperative – Antelope Valley Station*. Through the four factor analysis, North Dakota identifies cost-effective controls at Antelope Valley Station for inclusion in the 2028 potential additional control modeling scenarios (PAC1 only). North Dakota noted that these control options are “in line with the control technologies and emissions rates of similar EGUs which were subject to the BART requirements.” For each of the two identical units, the cost-effective SO₂ controls include increasing the stoichiometric ratio (Ca:S) on the existing flue gas desulfurization unit that would reduce SO₂ by 2,900 tons per year at a cost of \$700 per ton of SO₂ reduced (PAC1 model scenario). North Dakota then rejects these cost-effective controls because 1) the “modeling has indicated no expected significant change in visibility” (for PAC 1),

⁴ <https://www.federalreserve.gov/releases/h15/>

and 2) the Class I areas in North Dakota are projected to achieve the URP. However, as noted in other comments here, North Dakota is likely to be improperly using the non-statutory factor of visibility as an additional factor to negate the four statutory factors. The use of additional factors may be appropriate to aid in the evaluation but not for the purpose of negating the underlying requirements in the four statutory factors. In addition, as noted in other comments, being below the glidepath is not an appropriate basis for rejecting cost-effective controls. Accordingly, using the four statutory factors, North Dakota should reassess its determination that these cost-effective controls are not warranted for Antelope Valley Station.

18. Section 5.2.11, *North Dakota Upstream Oil and Gas Development (Area Sources)*. North Dakota elects not to evaluate SO₂ emission controls for upstream oil and gas sources because “NO_x emissions are the primary concern.” However, the state’s emissions analysis of upstream oil and gas sources in Section 4.3.1 shows large current (RepBase2) SO₂ emissions of 9,391 tons per year increasing to 15,203 tons per year in 2028 (2028OTB) (per Table 27). Accordingly, we recommend that North Dakota reassess its decision to not evaluate SO₂ controls for upstream oil and gas sources, or in the alternative, provide a technical basis for excluding SO₂ emissions analysis of upstream oil and gas sources given the large SO₂ emissions from these sources and explain why not implementing additional controls on this sector fulfills the state’s regional haze requirements.
19. Section 5.2.11.1, *Wellsite Engines*, page 102. North Dakota concludes that individual engine controls are not reasonable because of “the limited emissions footprint from any single wellsite and relatively small contribution to visibility impairment from this sector.” However, source apportionment analysis, as presented in Appendix C.2, indicates that the NO_x emissions from the oil and gas sector are the largest contributor to U.S. anthropogenic ammonium nitrate impairment at certain Class I areas in 2028. For example, at Lostwood Wilderness Area and Theodore National Park, the contribution to ammonium nitrate light extinction from the oil and gas sector in North Dakota is by far the largest for any state-sector in the WRAP region. Moreover, wellsite emissions account for 50% of the upstream oil and gas emissions which in turn account for the bulk of the emissions from the oil and gas sector.⁵ Given the source apportionment analysis demonstrating large impacts from oil and gas NO_x emissions, North Dakota should reassess its statement in the SIP regarding individual engine controls and evaluate whether wellsite engines can be controlled as a sector (through a statewide rule), using the four statutory factors, or, conversely, explain how not controlling their oil and gas sources nonetheless fulfills their reasonable progress requirements.
20. Section 5.3.3, §51.308(f)(2)(iv)(C) - *Source Retirement and Replacement Schedules*. To the extent North Dakota is relying on anticipated fuel switching, existing retirements, or anticipated source retirements as part of its long-term strategy for making reasonable progress, those retirements and fuel switches must be enforceable and in the SIP. See Clarifications Memo at 10; Comment 2 above regarding enforceability requirements in a SIP under CAA Section 110(a).
21. Section 6, §51.308(f)(3) – *Modeling of Long-Term Strategy to Set Reasonable Progress Goals*. North Dakota appears to have set the reasonable progress goals (RPGs) for Lostwood Wilderness

⁵ Additional Reasonable Control Strategies for Oil and Gas Emission Sources in the WESTAR-WRAP region, Memorandum, Table 1, Ramboll, March 23, 2020.

Area and Theodore Roosevelt National Park based on on-the-books control measures anticipated by 2028. However, the RPGs should be based on North Dakota's LTS, the LTSs of other states that may affect a Class I area, as well as other CAA requirements, which can be implemented by the end of the planning period. Guidance at 46-48; Clarifications Memo at 6. Even if North Dakota ultimately elects not to require additional control measures, the reported RPGs fail to reflect additional control measures in other states.

22. Section 6.1.1, *Modeling of Additional Potential Controls and elsewhere*. North Dakota argues that the costs of additional controls are not justified by the modeled visibility improvements, which the state characterizes as not being meaningful. For example, North Dakota asserts that the modeled visibility improvement of 0.1 dv at Lostwood Wilderness Area is insufficient to justify a combined capital cost of approximately \$150 million and a combined annualized cost of approximately \$30 million.⁶ See our comment above regarding how states can properly consider visibility benefits as an optional additional factor in a four factor analysis.
23. Section 6.1.1, *Modeling of Additional Potential Controls and elsewhere*. In Section 6.1.1 the state discusses modeling results for two potential additional control scenarios (PAC1 and PAC2) to evaluate "how sensitive is the model to the magnitude of reductions evaluated and will this meaningfully impact future visibility." Figure 46 shows the effects of the PAC1 and PAC2 emissions reductions on the modeled RPG in 2028 and compares the RPGs to the URP in 2028. This approach correctly shows the modeled visibility progress relative to polluted conditions in 2028; however, this is not the approach that EPA Guidance recommends for evaluating visibility benefits when making control strategy decisions. Because the 2028 conditions still include substantial anthropogenic impairment, the 2028 model RPGs underestimate the visibility benefits of the PAC1 and PAC2 scenarios compared to natural visibility conditions. On page 16 of the Guidance, EPA states:

A state should not evaluate the visibility impact of a source by only using a delta deciview value for which the current visibility condition, or the projected 2028 condition, is the "background" in the delta deciview calculation. The "background" value should be the light extinction due to natural sources only. EPA recommends the use of the natural condition values included in the December 2018 Technical Guidance on Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program as the background value.

Thus, when evaluating visibility changes in deciviews, an additional calculation is required to evaluate the visibility benefits of PAC1 and PAC2 relative to natural visibility conditions using this equation:

$$\text{Visibility improvement} = 10\ln(\text{PAC extinction} + \text{natural extinction})/10) - 10\ln(\text{natural extinction})/10)$$

Where "PAC extinction" represents the change in light extinction in each of the PAC1 and PAC2 control scenarios, "natural extinction" represents the natural light extinction in inverse megameters at each Class I area, and "10" represents default Rayleigh scattering light extinction. A state may

⁶ The costs noted are associated with potential additional controls at three facilities – Coyote Station, Antelope Valley Station, and Coal Creek Station – which would result in combined annual SO₂ and NO_x reductions of approximately 22,000 tons per year as reflected in Tables 18, 21, 23 of the draft SIP.

use the average of the daily visibility benefits on the 20 percent most anthropogenically impaired days as its visibility benefit metric. However, alternative metrics may be more appropriate when examining visibility impacts from individual sources. Modeled demonstrations that provide a single year of meteorological regimes at a given Class I area may not capture days over the broader multi-year period where a source may be contributing to visibility impairment. Depending on wind direction and other meteorological factors, emissions from a single source may not always or frequently impact a particular Class I area. But there may be individual day visibility impacts that may be important to consider. Therefore, for individual sources (such as Coyote and Antelope Valley), the maximum daily visibility impact on all days may be a more meaningful metric. A state may instead, or also, consider the maximum daily visibility benefit within the most impaired days or the values of visibility benefits on other days. Guidance at 15 and 35.

In summary, while the procedures used in the WRAP modeling for the RPG estimates in 2028 are consistent with EPA Guidance for comparing RPGs to the URP in 2028, additional analysis of day specific visibility benefits relative to natural visibility conditions is needed if the modeled visibility results are to be used to inform decisions about control strategies for specific facilities.

24. Equity and Environmental Justice. We encourage North Dakota to consider whether the SIP revision will result in equity and environmental justice impacts or impacts on any potentially affected communities. We also encourage North Dakota to describe any outreach to environmental justice communities that the state conducted, the opportunities North Dakota has provided for communities to give feedback on its proposed strategy, and the consideration North Dakota gave environmental justice in its technical analyses. See Clarifications Memo at 16.
25. Appendix A, *Department Four-Factor Summaries*. Throughout, for each of the selected sources, and for each emission unit evaluated, we recommend the appendix document and identify existing emission limits and where those limits are located (e.g., in the SIP, in a federal and/or state permit, in a consent decree). In addition, we recommend that it discuss how they compare to the baseline emissions used in the four-factor analyses. Some of this information is already contained in Tables 22 and 24 of Sections 4.2.1.1.1 and 4.2.1.1.2.
26. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. In Table 6 and throughout, specify the averaging period for the lb/MMBtu emission rates.
27. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. For clarity, in Tables 6 and 7 and throughout, use “LNC3+ w/SNCR” or “LNC3+ w/SCR” where SNCR or SCR are evaluated in combination with LNC3+. This is consistent with how the control options are described in Table 8 and elsewhere.
28. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. In Table 8, include the incremental cost-effectiveness of LNC3+ with SCR over LNC3+ with SNCR. It is given as \$12,200/ton at the bottom of page F.1-8.
29. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. When discussing remaining useful life, specify the equipment life used for each control technology evaluated relative to the remaining useful life of the source.

30. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. When evaluating visibility impacts, we recommend that visibility impacts be presented and evaluated on a per unit basis in parallel to the per unit costs of compliance in section 3.4.1.
31. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*. When evaluating visibility impacts, we recommend that North Dakota base its BART determination on the year with the highest visibility improvement rather than the average of the three modeled years (2000-2002).
32. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*, page F.1-14 and F.1-15. In addition to incremental cost-effectiveness, discuss whether the state finds the average cost-effectiveness for each control option reasonable. Specifically, describe whether the average cost-effectiveness of each of the control options is considered reasonable relative to any cost thresholds previously used by the state (when adjusted for inflation).
33. Appendix F.1, *NO_x BART analysis for Coal Creek Station Unit 1 and Unit 2*, page F.1-15. Consistent with the BART Guidelines, specify the incremental cost-effectiveness of LNC3+ with SCR relative to the next most stringent control option, LNC3+ with SNCR.

D.5 – Department Response to Public Comments

NDDEQ Response to Comments

NDDEQ Response to U.S Environmental Protection Agency (Appendix D.6-583)

Introduction and Background for NDDEQ's response to EPA comments

EPA submitted two sets of comments to NDDEQ - on January 13, 2022, and on June 1, 2022, respectively. The first and second set of comments each contained 33 comments and are nearly identical. See Appendix D.6 for the comments submitted by EPA during the public comment period. See Appendix D.4 for the comments submitted by EPA on January 13, 2022.

Of note, NDDEQ made several changes to the RH SIP revision between the FLM consultation period and the public comment period.

EPA Comment 1

Overall comment on the regional haze "reasonable progress" requirement. The Regional Haze Rule establishes a framework of periodic SIP revisions to implement Congress' requirement that states' SIPs include long-term strategies for making reasonable progress towards the national visibility goal. To this end, 40 CFR 51.308(f) requires that each periodic SIP revision contain a strategy for making reasonable progress for the applicable period. The increment of progress that is "reasonable progress" for a given implementation period is determined through the four factors. 40 CFR 51.308(f)(2)(i). EPA has explained that reasonable progress cannot be determined prior to or independently from the analysis of control measures for sources. See 82 FR 3078, 3091/3 (Jan. 10, 2017); Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period (July 8, 2021; hereinafter "Clarifications Memo") at 6.¹ North Dakota must therefore determine what is necessary to make reasonable progress in the second implementation period by using the four factors to analyze control measures for sources. We acknowledge the progress made in the first implementation period, and that ongoing emission trends and anticipated changes in emissions may inform a state's regional haze planning process. However, these circumstances alone do not satisfy a state's obligation to include the measures that are necessary to make reasonable progress in its RH SIP revision.

NDDEQ Response to EPA Comment 1

NDDEQ considered the four statutory reasonable progress factors (as documented in the Four Factor Analyses in Appendix A), analyzed the availability, effectiveness and cost of additional control measures, and concluded that visibility improvement in North Dakota's Class I areas is occurring at the pace appropriate to achieve the national visibility goal (i.e., making reasonable progress).

The Clean Air Act (CAA) Visibility Protection Program's primary goal is to improve visibility. EPA interprets the CAA and the Regional Haze Rule to allow a state reasonable discretion to consider the anticipated visibility benefits of an emission control measure along with the other factors when

¹ "Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period," available at <https://www.epa.gov/visibility/clarifications-regarding-regional-haze-State-implementation-plans-second-implementation>.

determining whether a measure is necessary to make reasonable progress.² In other words it is the main context in which the four reasonable progress factors are considered. EPA acknowledges that it is reasonable for a state to consider whether and by how much an emission control measure would help achieve the visibility goal and it is reasonable that information on visibility benefits be considered in light of other factors that may weigh for or against the control at issue. Such a balancing of outcomes is consistent with CAA section 169A(b)(2).³

NDDEQ utilized this discretionary authority when considering additional controls. NDDEQ determined, for any of the reasonable progress controls to be considered necessary to achieve the visibility goals, there must be an anticipated corresponding improvement projected in the visibility conditions (i.e., the Clean Air Act's regional haze/visibility protection program does not require controls for controls' sake, unrelated to improved visibility). Using the modeling data, NDDEQ was able to determine the degree of anticipated visibility improvement for multiple unique long-term strategies with differing levels of potential reasonable controls in place. Consistent with EPA's Guidance at 35, NDDEQ calculated the modeled visibility benefit by making multiple air quality modeling runs, with and without the measures assumed to be in place.⁴ Evaluating the modeled visibility results and four factor data in tandem allowed NDDEQ to determine what was necessary to include for reasonable progress during this planning period.

This effort shows that NDDEQ did not summarily dismiss any potentially reasonable control options under evaluation. See NDDEQ Response to EPA Comment 12, which addresses allegations of NDDEQ summarily dismissing cost-effective potential controls.

EPA's 2019 Guidance was not the first time EPA articulated its position on the importance of visibility to the regional haze program. When developing Subpart P – Protection of Visibility standards, EPA included several key definitions⁵ which indicate measurement of perceptibility of visibility (using the deciview metric) is an important concept and not something which is secondary to the four reasonable progress factors. Specifically, 40 CFR 51.308(f)(3) requires that the long-term strategy and the reasonable progress goals provide for an improvement in visibility for the most impaired days since the baseline period and ensure no degradation in visibility for the clearest days since the baseline period, supporting the notion that visibility and change in visibility are core aspects of the program and the evaluation of the effectiveness of potential controls. NDDEQ's proposed RH SIP revision meets both statutory requirements. In addition, when NDDEQ was developing its long-term strategy, NDDEQ was required to consider the anticipated net effect on visibility due to projected changes in point, area, and mobile source emissions over the period addressed by the long-term strategy⁶. This is precisely what NDDEQ has done and presented in the RH SIP revision.

² EPA's Guidance on Regional Haze State Implementation Plans for the Second Implementation Period (August 20, 2019; hereinafter "Guidance"), page 36 and 37

³ Guidance at 37

⁴ RH SIP revision Section 6.1.1.

⁵ 40 CFR 51.301 Definitions.

⁶ 40 CFR 51.308(f)(2)(iv)(E).

The technical support for the modeled visibility data utilized by NDDEQ was developed by the WRAP Regional Technical Operations (RTO) Work Group, meeting the requirements of 40 CFR 51.308(f)(2)(iii). WRAP contracted Ramboll, Inc. for development of the modeling platforms utilized in the regional haze planning efforts. The technical analyses were developed following various EPA guidance documents⁷ with review and input from the various RTO Work Group members, including the Co-chairs⁸ who led the effort. In other words, the data presented by NDDEQ in this RH SIP revision is not unique to North Dakota and is consistent with each of the 13- contiguous WRAP states.

The following table was created from information presented in Section 4 of the RH SIP revision. This table shows that North Dakota will make reasonable progress through the reductions anticipated to occur between representative⁹ and 2028¹⁰ emissions. The table presents the cumulative NO_x and SO₂ emissions from North Dakota's point source sector (e.g. EGUs), non-point sector (e.g. upstream oil and gas) and on-road and non-road engines sector. Emissions presented are for the representative baseline (RepBase) and 2028 baseline (2028OTB).

Pollutant	SO₂	NO_x	NO_x + SO₂	% Reduction from RepBase
RepBase	57,686	168,157	225,843	--
2028OTB	60,091	119,949	180,040	20.3%

As shown in the table above, NDDEQ anticipates a 20% reduction (~45,800 tons) in anthropogenic NO_x and SO₂ emissions, from the referenced sectors and from the RepBase to the 2028OTB emissions scenario. As presented in Appendix C.1-1 for Theodore Roosevelt National Park, the modeling shows an expected visibility improvement on the most impaired days resulting from this reduction.

It is also worth noting that North Dakota is one of only four States in the nation that has never violated a NAAQS. In other words, North Dakota is expecting significant anthropogenic NO_x and SO₂ reductions and these reductions have been modeled to show an improvement in visibility for the most impaired days, and thus reasonable progress, meeting a core requirement of the CAA visibility program.

[EPA Comment 2](#)

Overall comment on enforceable measures in SIPs. Section 110(a) of the Clean Air Act (42 USC section 7410(a)) outlines the requirement that SIPs contain enforceable emissions limitations and other control measures, means, or techniques relied on and include a program for the enforcement of the measures. Therefore, any emission limits or control measures ultimately relied on by North Dakota to make reasonable progress must be in the SIP and accompanied by provisions to ensure that the emission limits or other control measures are enforceable. EPA's Guidance on Regional Haze State

⁷ Appendix C.5.

⁸ WRAP RTO co-chairs for round 2 planning were: Gail Tonnesen (EPA R8), Mike Barna (National Park Service) and Kevin Briggs (State of Colorado).

⁹ For a detailed explanation of RepBase emissions refer to Section 4.1.4. Generally, RepBase can be thought of as a 3-year (2016–2018) average.

Implementation Plans for the Second Implementation Period (August 20, 2019; hereinafter “Guidance”) at 42. Also, see 40 CFR 51.308(f)(2). See related comment number 20 below.

NDDEQ Response to EPA Comment 2

In addition to existing ND Regional Haze SIP’s enforceable requirements, the proposed RH SIP revision contains additional enforceable requirements for further reducing visibility-impairing emissions from the following North Dakota sources: Coal Creek Station¹¹, Heskett Station¹², and Hess Tioga Gas Plant¹³.

EPA Comment 3

Section 2.4, North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs. North Dakota should clarify whether this section, along with the Weighted Emissions Potential (WEP) and Area of Influence (AOI) products in Appendix C.3, are intended to represent North Dakota’s determination of which Class I areas in other states may be affected by emissions from North Dakota, as is necessary under 40 CFR 51.308(f)(2). In this section, or elsewhere in the SIP, North Dakota should explicitly identify which Class I areas in other states may be affected by emissions from North Dakota, as well as the basis for making that determination. In addition, the determination should be based on the visibility impairment contributed to by all types of anthropogenic sources (such as major and minor stationary sources, mobile sources, and area sources) in the state, not merely large point sources. See Guidance at 8.

EPA Comment 4

Section 2.4, North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs. Statements in this section appear to conflict with the state’s evaluation of the WEP/AOI analysis in Appendix C.3. Specifically, this section states that the impacts from North Dakota sources to Class I areas in other states are “insignificant,” while the WEP/AOI results in Appendix C.3, and the state’s evaluation of those results, indicate otherwise. For example, as shown Appendix C.3, emissions emanating from North Dakota, and in particular emissions from the EGU and oil and gas sectors, have among the highest potential to impair visibility at Medicine Lake Wilderness Area in Montana.¹⁴ In fact, in Section 5.1 and Appendix C.3, North Dakota cites these impacts as justifying the state’s consideration of additional controls for sources in the EGU and oil gas sectors under four factor analyses. Given the relatively large potential of sources in North Dakota to impair visibility, we recommend that the state reassess whether its emissions affect visibility impairment in Class I areas in other states.

EPA Comment 5

Section 2.4, North Dakota sources identified by downwind states that are reasonably anticipated to impact CIAs. In addition to the WEP/AOI analysis, we recommend that North Dakota consider WRAP’s source apportionment analysis (2028OTBa2, low-level) when determining which Class I areas in other

¹¹ Section 5.2.4, Section 8, Appendix F.

¹² Section 5.2.6, Appendix A.6.

¹³ Section 5.2.8, Appendix A.8. The 2028 baseline emissions projection did not consider emissions reductions associated with this action since they were not enforceable at the time the various visibility modeling analyses were conducted.

¹⁴ Appendix C.3, Figures 13 through 16.

states may be affected by emissions from sources in North Dakota under 40 CFR 51.308(f)(2). EPA notes that the WRAP's source apportionment analysis indicates that North Dakota sources, such as those from the EGU and oil and gas sectors, are among the largest contributors to U.S. anthropogenic impairment due to ammonium nitrate and ammonium sulfate in 2028. For example, at Badlands National Park, the contribution to ammonium sulfate light extinction from the EGU sector in North Dakota is the largest for any state-sector in the WRAP region. Similarly, at Badlands National Park, the contribution to ammonium nitrate light extinction from the oil and gas sector in North Dakota is the largest for any state-sector in the WRAP region.¹⁵ Moreover, for all anthropogenic source categories combined, North Dakota contributes more to ammonium nitrate and ammonium sulfate light extinction at Badlands National Park than any other state in the WRAP region. Given these relatively large contributions from sources in North Dakota, we recommend that the state reassess whether its emissions affect visibility impairment in Class I areas in other states.

NDDEQ Response to EPA Comment 3, 4, and 5

Weighted Emissions Potential (WEP) and Area of Influence (AOI) products were developed by WRAP for regional haze planning uses in the western U.S.¹⁶ The analysis was performed for the most impaired days during each year of the 5-year period from 2014 through 2018 at 76 IMPROVE monitoring sites representing the 116 Class I Areas in the 13 states of the contiguous WESTAR-WRAP region and neighboring states. WEP maps illustrate the geographic areas of greatest emissions influence for aerosol extinction on most impaired days and define the relative source importance for each Class I area.

The WEP/AOI results presented in Appendix C.3 show potential sector impacts to visibility relative to anthropogenic emissions. The potential impacts identified through the WEP/AOI results at each of the Class I areas included in Appendix C.3 warranted NDDEQ's consideration of additional controls on the various sectors referenced.¹⁷ The Class I areas presented in Appendix C.3 were selected since these are the Class I areas potentially affected by emissions from within North Dakota. Appendix C.3 is not limited to large point sources, but includes Total Anthropogenic, Oil and Gas, EGUs, On-road mobile, and off highway mobile (Non-road) impacts¹⁸. Additionally, Table 39 in Section 9.3.3 of the RH SIP revision shows North Dakota's relative Contribution to Species Light Extinction in Nearby Class I Areas.

NDDEQ engaged the nearby states of Minnesota, Montana, and South Dakota during development of the RH SIP revision. As part of this effort, on June 9, 2021¹⁹, North Dakota reached out to these states and asked for their input regarding North Dakota's position that North Dakota sector contributions do not appear to be significantly impacting visibility in the Class I areas of their state on the most impaired days. North Dakota went on to state that "should (Minnesota, Montana, South Dakota) disagree with

¹⁵ Based on WRAP state-sector source apportionment results available in the Technical Support System at <https://views.cira.colostate.edu/tssv2/Express/ModelingTools.aspx>.

¹⁶ Appendix C.5, starting on page C.5-44.

¹⁹ Appendix E, page E.2-103 through E.2-107

this position, please notify North Dakota accordingly. Notification can be provided at any time, before or during the required public comment period.”

North Dakota’s coordination with neighboring states is also addressed in Section 2. As stated in Section 2.1.2 through 2.1.5 of the proposed RH SIP, no neighboring states have identified or notified NDDEQ of sources in North Dakota which are reasonably anticipated to impact visibility in the Class I areas of their state. Under 40 CFR 51.308(f)(2)(ii)(B), *“the State must consider the emission reduction measures identified by other States for their sources as being necessary to make reasonable progress in the mandatory Class I Federal area”*. NDDEQ has not received such a request from any state.

Under 40 CFR 51.308(f)(2)(ii)(C), NDDEQ has also not disagreed with any State outside of North Dakota regarding emission reductions measures.

EPA’s comment on North Dakota’s allegedly “relatively large” contributions to visibility impairment from the EGU and oil and gas sectors is misleading. North Dakota sources have a relatively large impact on US anthropogenic visibility impairment while concurrently having a small impact on absolute visibility impairment. This is because relative impairment focuses solely on the US anthropogenic sources while absolute impairment focuses on all contributors to visibility impairment. For example, if all States outside of North Dakota eliminated all anthropogenic emissions, North Dakota would then account for 100% of the anthropogenic (or relative) impairment. Even if North Dakota were to reduce 99% of its anthropogenic emissions, North Dakota would still account for 100% of the relative impairment. Without this context, relative contributions have the potential to misrepresent absolute visibility impairment caused by North Dakota sources.

At times it may be important to focus on relative impacts, such as when relative impacts are also a reasonable portion of the absolute impacts. However, this is not the current state of the visibility conditions in North Dakota’s or nearby state’s Class I areas.

North Dakota sources contribute a minimal amount to the absolute (or total) visibility impairment in North Dakota Class I Areas, see Section 3.1 of the RH SIP revision. North Dakota’s visibility impact to out of state Class I Areas is inherently less due to the proximity of North Dakota sources being nearer to North Dakota Class I Areas when compared to out of state Class I Areas. This lack of absolute visibility impairment from North Dakota sources is likely a major reason no states have requested NDDEQ implement the potential additional control measures evaluated by NDDEQ.

[EPA Comment 6](#)

Section 3.1, Visibility Summary. Based on source apportionment modeling, North Dakota presents the state’s percentage contribution to total visibility impairment from ammonium nitrate and ammonium sulfate to Class I areas within the state (as light extinction). Among other things, as presented the total visibility impairment includes that from international emissions, natural emissions, and Rayleigh background. The national goal of the visibility protection program is to prevent any future and remedy any existing anthropogenic visibility impairment in Class I areas. Clean Air Act section 169A(a). The state should focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable

progress towards the national visibility goal. We acknowledge that North Dakota cannot directly control emissions from international anthropogenic sources. Nonetheless, the state can focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable progress towards the national visibility goal. Therefore, North Dakota should present the state's percentage contribution to total anthropogenic and/or U.S. anthropogenic impairment. Comparing the contribution from North Dakota sources to the contribution from all sources (including natural and Rayleigh), rather than that from anthropogenic sources, has the effect of understating the percent contribution by North Dakota to sources of visibility impairment that can be controlled.

NDDEQ Response to EPA Comment 6

NDDEQ has included an analysis showing North Dakota's own anthropogenic contributions to visibility impairment in the RH SIP revision. NDDEQ presented North Dakota's contributions to visibility impairment in North Dakota's Class I areas in Appendix C.2, starting on page C.2-15. Ammonium nitrate and ammonium sulfate, as shown in the RH SIP revision²⁰, are the species of most concern during this planning period. The information in Appendix C.2 shows, in absolute terms and on a percentage basis, how much of the U.S. anthropogenic impairment from ammonium nitrate and ammonium sulfate is from North Dakota's sources.

EPA Comment 7

Section 4.2.1.1.1, SO₂ Emissions from North Dakota Coal Fired EGUs and Section 4.2.1.1.2, NO_x Emissions from North Dakota Coal Fired EGUs. Tables 22 and 24, for SO₂ and NO_x, respectively, provide a comparison between the representative annual baseline emission rate (lb/MMBtu) and the most stringent existing or proposed emission limit for selected EGUs. These comparisons should prove useful in relation to our comments below regarding 1) whether existing measures are necessary to make reasonable progress and need to be included in the long-term strategy, and 2) emission limit tightening. For EGUs with only a 3-hour rolling average emission limit for SO₂ (which is generally much higher than the indicated annual performance rate), we recommend that the state consider adding a 30-day rolling average emission limit that is either reflective of any new controls ultimately selected through the SIP development process, or at a minimum, that are commensurate with the performance of existing controls. In addition, we recommend, that to the extent possible, North Dakota provide a similar table for selected non-EGU sources.

NDDEQ Response to EPA Comment 7

NDDEQ considered EPA's request to add a 30-day rolling average SO₂ emissions limit on select EGUs and concluded the requested limits or restrictions are not appropriate or necessary to make reasonable progress in the proposed RH SIP revision. All controls measures relied upon by NDDEQ in the RH SIP revision are currently included in the RH SIP revision²¹ or in federally enforceable Title V Permits to

²⁰ Section 5.1

²¹ See NDDEQ Response to EPA Comment 2.

Operate. NDDEQ addresses the “emissions limit tightening” concept in NDDEQ Response to EPA Comment 11.

NDDEQ also considered EPA’s request to provide a similar Table 22 and Table 24 for the selected non-EGU sources. The information in Tables 22 and 24 was provided to show a direct comparison of emissions, representative emissions performance, and controls across the North Dakota coal fired EGU sector. While not all coal fired EGUs in North Dakota operate the same, they do operate in the same sector and the tables are useful to cross compare the facilities. Providing this data for the non-EGU sector is less helpful, as these sources are not limited to one sector (like coal fired EGUs) and have significantly different operations. The non-EGU sources evaluated include two operationally different gas processing plants, a coal gasification plant, and a compressor station. Providing similar tables for the non-EGUs would not add value to the information provided in the sections referenced by EPA. Therefore, NDDEQ has not provided additional tables for the non-EGUs sources. Further, NDDEQ believes sufficient representative operational information for each of the non-EGU sources has already been provided in Appendix A of the proposed RH SIP revision.

[EPA Comment 8](#)

Section, 5.1.2 Determination of Subject Facilities. In the Q/d analysis used to select sources for four factor analysis, North Dakota uses average annual emissions from 2012 through 2016. To meet the requirements of 40 CFR 51.308(f)(2)(iii) of the regional haze rule, “emissions information must include, but need not be limited to, information on emissions in a year at least as recent as the most recent year for which the state has submitted emission inventory information to EPA as part of the triennial National Emissions Inventory process.” Guidance at 17 and 18. Accordingly, we recommend that the state assess whether using more recent emissions data (2017 or newer data) would alter which sources are selected for four factor analysis.

Additionally, North Dakota states that it used a Q/d of 10 when determining which sources would be selected for a four-factor analysis. However, North Dakota does not explain why that threshold was selected, how the threshold was selected, or how the threshold will ensure that a reasonable set of sources are selected for four factor analyses. EPA suggests that North Dakota include additional explanation as to how their source-selection will result in fulfillment of its reasonable progress requirements.

[NDDEQ Response to EPA Comment 8](#)

NDDEQ used average emissions from 2012-2016 for the major stationary point sources as this was the most readily available data when NDDEQ’s regional haze planning for round 2 began, in Spring of 2018²². Changing the emissions year to 2017 has no impact on the selected sources for four-factor analysis. Further, NDDEQ’s selected sources are also consistent with and were confirmed with the National Park Service in 2019²³.

²² Appendix E, page E.2-14 and E.2-15. Also see “Department Request” in Appendix B.#.a, where “#” can be “1-10” and correlates to each facility a request was sent.

²³ Appendix E, page E.2-7 through E.2-11

Appendix E pages E.2-7, E.2-14 and E.2-15 provide the rationale for the selection of sources for four factor analysis and the reason a Q/d of ~10 was chosen. Using a Q/d of ~10 captured ~94% of the 2012-2016 emissions from North Dakota's stationary sources. A Q/d of 10 is also consistent with the "Federal Land Managers' Air Quality Related Value Work Group Phase 1 Report – Revised (2010)" (FLAG 2010) report²⁴.

EPA Comment 9

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources, and subsections. In several places, North Dakota states that the Class I areas in North Dakota are under the projected 2028 adjusted glidepath. We recommend that North Dakota refrain from relying on the fact that the Class I areas remain below the adjusted glidepath projected to 2028 to determine whether additional controls are necessary for reasonable progress in the second planning period. We have stated repeatedly that the uniform rate of progress or glidepath is not a "safe harbor" and that Class I areas' position vis-à-vis the glidepath cannot be a basis for justifying a particular set of controls or decision to not require controls. Instead, the uniform rate of progress is a planning metric used to gauge the amount of progress made thus far and the amount left to make. Because the uniform rate of progress is not based on the four statutory factors, it cannot be used to determine whether the amount of progress made in any particular implementation period is reasonable. See Guidance at 50 and Clarifications Memo at 15. While we recognize the progress North Dakota has made to date, we recommend that North Dakota determine reasonable progress through application of the four statutory factors to sources and to seek meaningful reductions in visibility impairing pollutants in the second planning period to build on the progress North Dakota has already achieved and continue progress towards natural visibility conditions for the two Class I areas within North Dakota and out-of-state Class I areas affected by emissions from North Dakota.

NDDEQ Response to EPA Comment 9

EPA stated, in the Federal Register at 82 FR 3078²⁵, that "...if [North Dakota] has reasonably selected a set of sources for analysis and has reasonably considered the four factors in determining what additional control measures are necessary to make reasonable progress, then [North Dakota's] analytical obligations are complete if the resulting RPG for the most impaired days is below the URP line."

NDDEQ did not use the glidepath as a "safe harbor." Rather, consistent with EPA's statement in the Federal Register, North Dakota reasonably selected a set of sources²⁶ for analysis and reasonably considered the four factors²⁷ in determining what additional control measures are necessary to make reasonable progress²⁸. Upon consideration, NDDEQ did not identify any additional control measures²⁹ as reasonable. If NDDEQ was using the glidepath as a "safe harbor", NDDEQ would not have evaluated the

²⁶ Section 5.1.2.

²⁷ Section 5.2.1 through Section 5.2.10 and Appendix A.1 through A.10.

²⁸ Section 6.1.

²⁹ Beyond what's already included in the proposed RH SIP revision as summarized in NDDEQ Response to EPA Comment 2.

reasonableness of additional controls (i.e., statutory four factor analysis). Therefore, NDDEQ met the analytical obligations since the resulting reasonable progress goals for the most impaired days are below the adjusted uniform rate of progress.

EPA Comment 10

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources. After a reasonable analysis of the four factors, if North Dakota determines, for a particular source, that no additional (i.e., new) measures are necessary to make reasonable progress, the state must determine whether the source's existing measures are necessary to make reasonable progress. See section 4 (pages 8 – 12) of the Clarifications Memo for information on determining when a source's existing measures are necessary to make reasonable progress. Generally, a source's existing measures are needed to prevent future emission increases and are thus needed to make reasonable progress. If North Dakota concludes that the existing controls at a selected source are necessary to make reasonable progress, North Dakota must adopt emissions limits based on those controls as part of its long-term strategy for the second planning period and include those limits in its SIP (to the extent they do not already exist in the SIP). Alternatively, if North Dakota can demonstrate that the source will continue to implement its existing measures and will not increase its emission rate and provide appropriate documentation to support its demonstration, it may be reasonable for the state to conclude that the existing controls are not necessary to make reasonable progress. In such case, the emission limits may not need to be adopted into the long-term strategy. As the SIP is currently drafted, it is unclear what measures the state considers to be necessary for reasonable progress and thus a part of the long-term strategy and which measures the state is merely discussing in its SIP narrative as part of its consideration of ongoing air pollution control programs. Therefore, we recommend that North Dakota make clear its determination for each source and explain whether it is including either existing or new emission limits for each source in the long-term strategy and SIP (or whether emission limits already exist in the SIP). See Guidance at 43; Clarifications Memo at 8-9.

NDDEQ Response to EPA Comment 10

All controls measures, new and existing, relied upon by NDDEQ are currently included in the RH SIP revision³⁰ or in federally enforceable Title V Permits to Operate. Since the regional haze rule does not specify a process to determine baseline actual emissions or to project future emissions, NDDEQ utilized the methodology in the prevention of significant deterioration (PSD) regulations.³¹ 40 CFR 52.21(b)(48) was utilized by NDDEQ to determine the baseline actual emissions presented in the RH SIP revision. 40 CFR 52.21(b)(41) was utilized to project future emissions³². NDDEQ believes following the PSD framework provides the most accurate and defensible estimations of baseline actual emissions and future expected emissions. Based on this analysis, NDDEQ projected that NO_x/SO₂ emissions would decrease by approximately 20.3% by 2028. Implementing the PSD methodology provides the

³⁰ See NDDEQ Response to EPA Comment 2.

³¹ 40 CFR 52.21.

³² Alternative called 'projected actual emissions'

documentation necessary to defend NDDEQ's expectations that the sources reviewed will continue to implement existing measures and will not increase emission rates.

EPA Comment 11

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources. Throughout, we recommend that for each of the selected sources the state consider whether a source can achieve or is already achieving a lower emission rate using its existing measures. If a source is operating or is capable of operating at a lower emission rate than assumed either (1) as the basis for not conducting a full four-factor analysis or (2) as the baseline for four-factor analysis, that lower rate should be analyzed as a potential control measure. See Clarifications Memo at 5, 7. For example, at Antelope Valley Station Units 1 and 2, where the existing NOX emission limit is 0.17 lb/MMBtu (30-day rolling average) at each unit, and where each unit has been operating consistently below 0.13 lb/MMBtu (monthly) for many years, we recommend that the state consider an emission limit commensurate with the actual operation and emissions of the source with existing measures. (The example is only in the instance where North Dakota ultimately elects not to require new or upgraded controls at Antelope Valley Station.) This is sometimes referred to as “emission limit tightening.”

NDDEQ Response to EPA Comment 11

NDDEQ did not use source emissions data which was lower than current representative operations as the basis for not conducting a full four-factor analysis or as the baseline for four-factor analysis. NDDEQ did, however, consider lowering source emission limits consistent with the baseline emissions rate used in each source’s four-factor analysis. Based on past operations and future projected operations, NDDEQ determined that it was not necessary to impose lower emissions limits. This is outlined in detail in NDDEQ Response to EPA Comment 10.

NDDEQ routinely monitors operations from the four factor sources through review of periodic reports, with much of the data coming from continuous emissions monitoring systems (CEMS). Continuing to review these periodic reports will inform NDDEQ to the accuracy of the emissions projections used in the RH SIP revision. Should NDDEQ receive information indicating the projected actual emissions for the four factor sources is inconsistent with the information provided in the RH SIP revision, NDDEQ will act accordingly to revise the baseline and projected emissions for the source and will re-evaluate the need for additional controls or emissions restrictions (i.e. emission limit tightening). NDDEQ also notes that the operation of existing air pollution control equipment in a manner to minimize emission is a general duty requirement of each sources’ Title V Operating Permit.

EPA Comment 12

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources. North Dakota rejects additional controls for selected sources, at least in part, on the basis that the state deems the modeled visibility improvements to “not be considered significant.” EPA has explained that states choosing to consider visibility benefits as an optional additional factor should not use visibility to summarily dismiss cost-effective potential controls, and that a state that has identified cost-effective controls but rejects most or all of them based on visibility benefits is likely to be improperly using visibility as an additional factor. Clarifications Memo at 13. In this case, it appears that North Dakota is rejecting all additional controls at

its selected sources, regardless of whether they are cost effective, because the Class I areas are below their uniform rates of progress and the potential emission reductions do not have a meaningful impact on visibility. These are generally inappropriate bases on which to make reasonable progress determinations for sources. Please see pages 12 and 13 of the Clarifications Memo for generally permissible ways to consider visibility in a four-factor analysis and control determination. We recommend that the state reconsider its four-factor analysis accordingly.

Relatedly, we note that whether a particular visibility impact is “meaningful” should be assessed in the context of an individual state’s contribution to impairment, as opposed to total impairment at a Class I area. Clarifications Memo at 14. As many of the largest individual visibility impairing sources have either already been controlled (under the RHR or other Clean Air Act or state programs) or have retired, the remaining individual sources are often smaller and better controlled, with each source making relatively smaller contributions to a class I area as a proportion of total impairment. This does not mean, however, that such sources need not be controlled. To the contrary, the evaluation and control of such smaller sources may be necessary to achieve the national goal of the prevention of any future, and the remedying of any existing, anthropogenic impairment of visibility in class I areas. Also, North Dakota states that the visibility improvements “are smaller than what is perceptible by an unaided human eye.” Visibility improvements need not be perceptible in order to justify additional controls. Guidance at 38 and Clarifications Memo at 14.

Furthermore, we caution North Dakota that it should not reject cost-effective controls and otherwise reasonable controls merely because some portion of visibility-impairing pollutants come from international sources. The national goal of the visibility protection program is to prevent any future and remedy any existing anthropogenic visibility impairment in Class I areas. Clean Air Act section 169A(a). We acknowledge that North Dakota cannot directly control emissions from international anthropogenic sources. Nonetheless, the state can focus on its own contributions to visibility impairment and must address the requirement to include emission limits and other measures for in-state sources that are necessary to make reasonable progress towards the national visibility goal.

[NDDEQ Response to EPA Comment 12](#)

NDDEQ developed the RH SIP revision pursuant to Clean Air Act §169A’s “Visibility Protection for Federal Class I Areas.” Under this program, visibility considerations are central to the development of a state’s reasonable regional haze plan. NDDEQ first determined what is appropriate and necessary. To determine this, the more important item to first consider over “monetary cost of controls” is “predicted improvement on visibility through implementation of controls”. The four-factor analyses include projected achievable emissions rates (or emissions reductions) associated with the varying types of controls evaluated. The potential visibility impact from these emissions reductions must be first evaluated to determine if the controls evaluated are appropriate and necessary. If the visibility improvements are determined to be necessary to achieve the planning goals, costs are refined from the original evaluation to determine if they are in fact reasonable and should be required for visibility improvement purposes. See NDDEQ Response to EPA Comment 1 for more detail on the importance of visibility.

North Dakota did not summarily dismiss cost-effective potential controls and is not improperly using visibility as an additional factor. Cost-effectiveness and visibility cannot be separated in the Clean Air Act's visibility protection program. For potential controls to be "cost-effective" in a visibility protection program, effectiveness must be based, at least in part, on the projected impact to visibility conditions: in this context, effectiveness refers to the evaluated control's impact on reducing impaired visibility. *Cost effectiveness, in general, is a criterion used to assess the potential for achieving an objective in the most economical way.* In other words, the cost-effectiveness of controls cannot be determined if only cost is considered, and the effect (i.e. the impact on visibility) is discounted.

NDDEQ developed its analysis in a manner consistent with the state's authority and discretion under the Clean Air Act. As such, NDDEQ determined that the potential additional controls (2028PAC1 and 2028PAC2) reviewed would have no effect on reducing anthropogenic visibility impairment³³ on the most impaired days. Therefore, it would not have been cost-effective (i.e., cost in relation to beneficial effect achieved) for NDDEQ to recommend the 2028PAC1 or 2028PAC2 scenarios be implemented during this planning period for regional haze. Under NDDEQ's most conservative emissions projections scenario for 2028 (2028OTB), both of North Dakota's Class I areas are expected to experience visibility improvements on the most impaired days, i.e., reasonable progress, meeting a core requirement of the CAA visibility program.

NDDEQ clarified the terminology used in the RH SIP revision between the FLM consultation draft and the public comment draft. During the FLM consultation, NDDEQ described modeled visibility improvements as not being "meaningful". Post FLM consultation, NDDEQ described modeled visibility improvements as not projected to provide a reduction in 'anthropogenic visibility impairment'³⁴. EPA's comment remains unchanged from January to June and therefore is not related to the updated text which was available for public comment.

The following information shows a cost-effectiveness evaluation of additional controls on a dollars (i.e. cost) per improvement in unit of deciview³⁵ basis (i.e. effectiveness). NDDEQ used the modeling results produced by WRAP and the four-factor cost information presented in Appendix A to quantify the dollars per deciview cost effectiveness for control options. The visibility improvement data and cost data is already provided in the RH SIP revision, NDDEQ has now taken this data one step further by converting the information provided into a cumulative cost of additional controls at several sources per combined modeled unit of visibility improvement. In other words, cost-effectiveness was not evaluated on a

³³ Section 6.1.1.

³⁴ Visibility impairment or anthropogenic visibility impairment means any humanly perceptible difference due to air pollution from anthropogenic sources between actual visibility and natural visibility on one or more days. Because natural visibility can only be estimated or inferred, visibility impairment also is estimated or inferred rather than directly measured.

³⁵ 40 CFR 51.301 "Deciview" is the unit of measurement on the deciview index scale for quantifying in a standard manner human perceptions of visibility. Further, deciviews are the metric used for tracking regional haze in the regional haze rules. The deciview index was designed to be linear with respect to human perception of visibility. A one deciview change is approximately equivalent to a 10% change in extinction in either direction. One deciview of change in visibility is generally considered to be the minimum change that the average person can detect with the naked eye.

source-by-source basis. The information presented below is not meant to set a bright line value associated with what NDDEQ would consider an acceptable dollar per deciview cost (i.e., cost-effectiveness), as this information changes which each planning period based on current conditions. This information is only meant to provide further context supporting North Dakota's position that the cost's significantly outweigh the benefits.

Using the visibility improvement data provided in Section 6.1.1 of the proposed RH SIP revision, the following dollars per unit of deciview improvement were calculated as follows:

- PAC1³⁶ results in a cost of approximately \$273 million per deciview at Lostwood Wilderness Area ("LWA") and \$360 million per deciview at Theodore Roosevelt National Park ("TRNP"). This comes from a cumulative annualized cost across all sources of \$30 million and expected improvements in visibility of 0.1 deciviews at LWA and 0.08 deciviews at TRNP.
- PAC2³⁷ results in a cost of approximately \$47 million per deciview at LWA and \$66 million per deciview at TRNP. This comes from a cumulative annualized cost across all sources of \$2 million and expected improvements in visibility of 0.04 deciviews at LWA and 0.03 deciviews at TRNP.

NDDEQ also followed EPA's preferred methodology³⁸ (see EPA Comment 23) to calculate deciview visibility improvement. As shown below, calculating the costs following EPA's preferred method reduces the expected dollars per deciviews of visibility improvement (compared to the above).

- PAC1 results in a cost of approximately \$103 million per deciview at LWA and \$170 million per deciview at TRNP. This comes from a cumulative annualized cost across all sources of \$30 million and expected improvements in visibility of 0.29 deciviews at LWA and 0.17 deciviews at TRNP.
- PAC2 results in a cost of approximately \$18 million per deciview at LWA and \$31 million per deciview at TRNP. This comes from a cumulative annualized cost across all sources of \$2 million and expected improvements in visibility of 0.12 deciviews at LWA and 0.07 deciviews at TRNP.

Converting the WRAP modeling (Section 6.1.1 of the RH SIP revision) to compare against the 2064 target (consistent EPA comment 23) results in a cost of \$103 million per deciview for PAC1 and \$18 million per deciview for PAC2 at LWA. These costs are even greater for TRNP.

³⁶ PAC1 modeling evaluated the reduction of approximately 18,100 tons of SO₂ and approximately 4,100 tons of NO_x, separate and in addition to the reductions already anticipated by 2028 discussed in the RH SIP and NDDEQ Response to EPA Comment 1. These reductions came from the evaluation of additional controls at Otter Tail Power Company – Coyote Station and Basin Electric Power Cooperative – Antelope Valley Station. Additionally, Unit 1 NO_x controls came online at Coal Creek Station in spring 2020 and are included in the PAC1 scenario. The PAC1 scenario is representative of the maximum potential controls originally considered for this planning period.

³⁷ PAC2 modeling evaluated the reduction of approximately 6,000 tons of SO₂ and approximately 1,000 tons of NO_x, separate and in addition to the reductions anticipated for 2028 discussed in the RH SIP and discussed in the RH SIP and discussed in NDDEQ Response to EPA Comment 1. These reductions came from the evaluation of upgraded controls at Otter Tail Power Company – Coyote Station and the same controls for Coal Creek included in PAC1.

³⁸ EPA's preferred methodology considers visibility improvements based on a clean background (natural conditions).

In conclusion, when evaluating visibility improvement following EPA's preferred method, the costs per unit of deciview improvement still indicate tens or hundreds of millions of dollars. This confirms that the controls evaluated are not cost-effective and that NDDEQ did not summarily dismiss cost-effective controls.

EPA Comment 13

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources and Appendix A. Throughout, we recommend that the costs of compliance be calculated consistent with the methods set forth in EPA's Control Cost Manual. We recommend that if North Dakota deviates from these methods that North Dakota explain, document, and provide a technical basis on how its alternative approach is appropriate. Guidance at 31.

NDDEQ Response to EPA Comment 13

Appendix B of the proposed RH SIP revision contains the cost information utilized by NDDEQ, which follows EPA's Control Cost Manual that recognizes states may use actual data when available in order to develop accurate estimates. NDDEQ evaluated and determined it was reasonable to rely upon the real-world data provided by the individual sources and their contractors.³⁹

As stated in the RH SIP revision, NDDEQ found no reason to object to the final detailed information provided to support the statutory four factor analysis. The final presented costs in Appendix A are in line with actual costs incurred from similar projects at similar sources in the first round of the regional haze program (adjusted to 2018 dollars). NDDEQ also believes the cost information provided in Appendix A and Appendix B is about 30% lower than it would be if estimated today (adjusted for inflation from 2018 to 2022). This means NDDEQ's control cost analysis in Appendix A likely understated costs. Refer to Appendix D.2.c – Department Response to FLM Feedback, page D.2.c-2. Since the response provided during FLM feedback, the Chemical Engineering Plant Cost Index (CEPCI) has increased an additional 5.5%⁴⁰. When compared to 2018 CEPCI value, the preliminary April 2022 CEPCI is 35.3% higher⁴¹.

EPA Comment 14

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources and Appendix A. Throughout, where a firm-specific interest rate is available, we recommend that it be used to assess costs. We also recommend that the basis for any firm-specific interest rate be well-documented and justified. For example, where applicable (e.g., for a regulated electric utility), North Dakota may choose to justify the rate based on the cost of capital, including from both equity and debt, approved for a particular company by the North Dakota Public Service Commission. If a firm-specific interest rate is not available,

³⁹ For example, see "Attachment 1 Sargent & Lundy, North Dakota Round II Regional Haze State Implementation Plan Determination's Four-Factor Analysis for Coyote Station; Response to National Park Service Air Resources Division Comments (May 31, 2022)" of "Comments of the Co-Owners of the Coyote Station on the North Dakota State Implementation Plan for Regional Haze:". Coyote Station Owners (Appendix D.6-313).

⁴⁰ <https://www.toweringskills.com/financial-analysis/cost-indices/>. Comparing November 2021 to preliminary April 2022 CEPCI values. $(815.7 - 773.1)/773.1 = 5.5\%$.

⁴¹ <https://www.toweringskills.com/financial-analysis/cost-indices/>. $(815.7 - 603.1)/603.1 = 35.3\%$.

then the bank prime rate (currently 3.25%⁴²) can be an appropriate estimate of the interest rate. These recommendations are consistent with EPA's Control Cost Manual at Chapter 2, page 15.

NDDEQ Response to EPA Comment 14

NDDEQ believes the determination to use an interest rate of 5.25% for the second planning period is appropriate. 5.25% was the bank prime rate at the time these analyses were prepared and was confirmed by EPA Region 8.⁴³ Changing the interest rate does not change any of the additional control measures determinations made by NDDEQ as interest rate has no effect on the impact controls have toward improving visibility. See NDDEQ Response to EPA Comment 12.

Of note, EPA recommends NDDEQ use the 'current' bank prime rate, but incorrectly states that this was 3.25% at the time EPA comments were submitted (June 1, 2022). The bank prime rate on June 1, 2022, was 4.00%. The bank prime rate as of August 1, 2022, was 5.50%.⁴⁴

EPA Comment 15

Section 5.2, §51.308(f)(2)(i) - Four Factors Analyses for Point Sources and Appendix A. Throughout, we recommend that the equipment life used to calculate costs for each control technology option, unless constrained by an enforceable retirement date for the source, be consistent with that found in the respective chapter of EPA's Control Cost Manual. Any deviations from EPA's Control Cost Manual need to be documented with an appropriate rationale provided as the basis for the deviation. Notably, the state's four factor analyses often use an equipment life of 20 years for selective catalytic reduction (SCR) and wet and dry scrubbers without a documented rationale to support a deviation, while the Control Cost Manual recommends an equipment life of 30 years. See Guidance at 33-34.

NDDEQ Response to EPA Comment 15

NDDEQ believes the determination to use an equipment life (or more appropriately, a loan amortization period) of 20 years is appropriate. Changing the equipment life does not change any of the additional control measures determinations made by NDDEQ as equipment life has no effect on the impact controls have toward improving visibility. See NDDEQ Response to EPA Comment 12. Of note, changing equipment life from 20 to 30 years is far less meaningful than updating the costs from 2018 dollars to today's dollars given the historic inflation the US is experiencing. As indicated in NDDEQ Response to EPA Comment 13, NDDEQ is likely significantly underestimating control costs if evaluated today.

EPA Comment 16

Section 5.2.1, Otter Tail Power Company – Coyote Station. Through the four factor analysis, North Dakota identifies cost-effective controls at Coyote Station for inclusion in the 2028 potential additional control modeling scenarios (PAC1 and PAC2). North Dakota noted that these control options are "in line with the control technologies and emissions rates of similar EGUs which were subject to the BART requirements." For the single unit at the facility, the cost-effective SO₂ controls include 1) replacing the existing SO₂ absorber module that would reduce SO₂ by 11,600 tons per year at a cost of \$1,800 per ton

⁴² <https://www.federalreserve.gov/releases/h15/>

⁴³ NDDEQ proposed RH SIP revision, Appendix E, page E.2-130 and E.2-131.

⁴⁴ As of August 1, 2022. See: <https://www.federalreserve.gov/releases/h15/>

of SO₂ reduced (PAC1 model scenario), and 2) flue gas desulfurization (FGD) efficiency improvements that would reduce SO₂ by 5,300 tons per year at a cost-effectiveness of \$400 per ton of SO₂ reduced (PAC2 modeling scenario). For NO_x, the cost-effective control options include selective noncatalytic reduction (SNCR) that would reduce NO_x by 3,000 tons per year at a cost-effectiveness of \$1,700 per ton of NO_x reduced (PAC 1 model scenario). North Dakota then rejects these cost-effective controls because 1) the “modeling has indicated no expected significant change in visibility” (for either PAC1 or PAC2), and 2) the Class I areas in North Dakota are projected to achieve the URP. However, as noted in previous comments, North Dakota is likely to be improperly using the non-statutory factor of visibility as an additional factor to negate the four factor requirements. In addition, as noted in other comments, being below the glidepath is not an appropriate basis for rejecting cost-effective controls. Accordingly, using the four statutory factors, North Dakota should reassess its determination that these cost-effective controls are not warranted for Coyote Station.

NDDEQ Response to EPA Comment 16

See NDDEQ Response to EPA Comment 12.

Visibility considerations were not used to negate the four factor requirements for Coyote Station⁴⁵. Rather, NDDEQ selected controls for additional evaluation based on the four-factor analysis⁴⁶. NDDEQ is not obligated to stop once the control costs are evaluated and proceed with final decisions on what controls are necessary. Upon NDDEQ’s complete evaluation and consideration of the four factors among other items, such as visibility, NDDEQ determined that it was not reasonable to require additional control on Coyote Station for visibility improvement purposes since North Dakota’s Class I area reasonable progress goals satisfy the statutory requirements of the visibility protection program for this regional haze implementation period.⁴⁷ NDDEQ also disagrees with EPA’s conclusory statement that the controls evaluated for the Coyote Station were “cost-effective.” As discussed in the RH SIP and the NDDEQ Response to EPA Comment 12, NDDEQ evaluated these controls in light of their effectiveness (i.e., effectiveness in reducing visibility impairment) and cost, and determined that they were not cost-effective.

EPA Comment 17

Section 5.2.2, Basin Electric Power Cooperative – Antelope Valley Station. Through the four factor analysis, North Dakota identifies cost-effective controls at Antelope Valley Station for inclusion in the 2028 potential additional control modeling scenarios (PAC1 only). North Dakota noted that these control options are “in line with the control technologies and emissions rates of similar EGUs which were subject to the BART requirements.” For each of the two identical units, the cost-effective SO₂ controls include increasing the stoichiometric ratio (Ca:S) on the existing flue gas desulfurization unit that would reduce SO₂ by 2,900 tons per year at a cost of \$700 per ton of SO₂ reduced (PAC1 model scenario). North Dakota then rejects these cost-effective controls because 1) the “modeling has indicated no expected significant change in visibility” (for PAC 1), and 2) the Class I areas in North Dakota are

⁴⁵ See Appendix A.1 for NDDEQ’s four-factor report for Coyote Station.

⁴⁶ Summarized in Section 4.1.7.

⁴⁷ Section 5.2.1 and Section 6.1.1.

projected to achieve the URP. However, as noted in other comments here, North Dakota is likely to be improperly using the non-statutory factor of visibility as an additional factor to negate the four statutory factors. The use of additional factors may be appropriate to aid in the evaluation but not for the purpose of negating the underlying requirements in the four statutory factors. In addition, as noted in other comments, being below the glidepath is not an appropriate basis for rejecting cost-effective controls. Accordingly, using the four statutory factors, North Dakota should reassess its determination that these cost-effective controls are not warranted for Antelope Valley Station.

NDDEQ Response to EPA Comment 17

See NDDEQ Response to EPA Comment 12 and NDDEQ Response to EPA Comment 16.

Visibility considerations were not used to negate the four factor requirements for Antelope Valley Station⁴⁸. Rather, NDDEQ selected controls for additional evaluation based on the four-factor analysis⁴⁹. NDDEQ is not obligated to stop once the control costs are evaluated and proceed with final decisions on what controls are necessary. Upon NDDEQ's complete evaluation and consideration of the four factors among other items, such as visibility, NDDEQ determined that it was not reasonable to require additional control on Antelope Valley Station for visibility improvement purposes since North Dakota's Class I area reasonable progress goals satisfy the statutory requirements of the visibility protection program for this regional haze implementation period.⁵⁰

EPA Comment 18

Section 5.2.11, North Dakota Upstream Oil and Gas Development (Area Sources). North Dakota elects not to evaluate SO₂ emission controls for upstream oil and gas sources because "NO_x emissions are the primary concern." However, the state's emissions analysis of upstream oil and gas sources in Section 4.3.1 shows large current (RepBase2) SO₂ emissions of 9,391 tons per year increasing to 15,203 tons per year in 2028 (2028OTB) (per Table 27). Accordingly, we recommend that North Dakota reassess its decision to not evaluate SO₂ controls for upstream oil and gas sources, or in the alternative, provide a technical basis for excluding SO₂ emissions analysis of upstream oil and gas sources given the large SO₂ emissions from these sources and explain why not implementing additional controls on this sector fulfills the state's regional haze requirements.

NDDEQ Response to EPA Comment 18

SO₂ emissions were excluded since the conservatively projected 15,000 tons of SO₂ in 2028 result from the projected cumulative operation of over 25,000 wells and associated equipment. As NDDEQ stated in the RH SIP revision for NO_x emissions from this sector, the same logic applies to SO₂ emissions: *"Individually, emissions from any one wellsite engine are minor, making any single sites contribution to visibility impairment insignificant."* Simple math shows that 15,000 tons of SO₂ divided by 25,000 sources

⁴⁸ See Appendix A.2 for NDDEQ's four-factor report for Antelope Valley Station.

⁴⁹ Summarized in Section 4.1.7.

⁵⁰ Section 5.2.1 and Section 6.1.1.

yields an average of 0.6 tons of SO₂ per wellsite.⁵¹ It is not reasonable to request installation of controls to reduce SO₂ emissions from wellsite's which, on average, emit 0.6 tons of SO₂ per well.

NDDEQ continues to see that the most practical and meaningful way to reduce SO₂ emissions from the Williston Basin is for North Dakota to continue making strides to reduce the amount of associated gas flared at wellsite's through infrastructure development and innovation. That said, NDDEQ did not take any credit for these efforts since they are not enforceable. Section 5.2.11.2 of the RH SIP revision shows the significant progress North Dakota has made toward this effort through 2020, and North Dakota continues to make progress in reducing the amount of gas flared through continued infrastructure development. Oil and gas production information from 2021 through April 2022 indicates that North Dakota has averaged a gas capture rate of over 93%.⁵²

North Dakota implements, at a minimum, the same standards EPA implements on Tribal land in North Dakota. Through existing practices, North Dakota is showing continued attainment status for SO₂, indicating the SO₂ emissions from oil and gas are not contributing to health-based air quality concerns. Therefore, it would be unreasonable for NDDEQ to implement additional controls on this sector.

EPA Comment 19

Section 5.2.11.1, Wellsite Engines, page 110. North Dakota concludes that individual engine controls are not reasonable because of "the limited emissions footprint from any single wellsite and relatively small contribution to visibility impairment from this sector." However, source apportionment analysis, as presented in Appendix C.2, indicates that the NO_x emissions from the oil and gas sector are the largest contributor to U.S. anthropogenic ammonium nitrate impairment at certain Class I areas in 2028. For example, at Lostwood Wilderness Area and Theodore National Park, the contribution to ammonium nitrate light extinction from the oil and gas sector in North Dakota is by far the largest for any state-sector in the WRAP region. Moreover, wellsite emissions account for 50% of the upstream oil and gas emissions which in turn account for the bulk of the emissions from the oil and gas sector.⁵³ Given the source apportionment analysis demonstrating large impacts from oil and gas NO_x emissions, North Dakota should reassess its statement in the SIP regarding individual engine controls and evaluate whether wellsite engines can be controlled as a sector (through a statewide rule), using the four statutory factors, or, conversely, explain how not controlling their oil and gas sources nonetheless fulfills their reasonable progress requirements.

NDDEQ Response to EPA Comment 19

NDDEQ implements the existing federal rules applicable to this sector on sources managed by NDDEQ. NDDEQ considered implementation of additional rules to limit NO_x emissions from individual engines but determined these were unnecessary. As NDDEQ considered engine standards, NDDEQ first reviewed

⁵¹ This simple calculation conservatively assumes all 15,000 tons of SO₂ is from stationary wellsite equipment and not from mobile sources.

⁵² <https://www.dmr.nd.gov/oilgas/stats/Gas1990ToPresent.xls> (Last visited July 12, 2022)

⁵³ Additional Reasonable Control Strategies for Oil and Gas Emission Sources in the WESTAR-WRAP region, Memorandum, Table 1, Ramboll, March 23, 2020.

the itemized emissions for an average wellsite.⁵⁴ Considering the total emissions from the sector, the emissions associated with wellsite engines, and the number of wellsites, it was determined that the engine NOx emissions are spread across thousands of individual sources resulting in minor emissions from each engine. Therefore, NDDEQ concluded that individual engine controls were unreasonable, as outlined in RH SIP revision Section 5.2.11. The main reasons for this decision include North Dakota being in attainment with all health-based air quality standards (one of only four states in the nation never to have exceeded NAAQs), the absolute impact to visibility impairment from this sector is limited⁵⁵, and the emissions which could be reduced per engine are minor. Like the controls evaluated for the EGUs under the 2028PAC1 and 2028PAC2 scenarios, NDDEQ would have modeled emissions reductions to determine anticipated impact on improving visibility if potentially cost reasonable NOx controls were identified. Therefore, the approach and consideration of potentially cost reasonable controls for upstream oil and gas was consistent with the large stationary sources evaluated by NDDEQ.

In summary, NOx emissions on an individual unit (per engine) basis are small and implementing controls to reduce these emissions would be not economically feasible and NDDEQ has not received any information to indicate otherwise.

EPA Comment 20

Section 5.3.3, §51.308(f)(2)(iv)(C) - Source Retirement and Replacement Schedules. To the extent North Dakota is relying on anticipated fuel switching, existing retirements, or anticipated source retirements as part of its long-term strategy for making reasonable progress, those retirements and fuel switches must be enforceable and in the SIP. See Clarifications Memo at 10; Comment 2 above regarding enforceability requirements in a SIP under Clean Air Act Section 110(a).

NDDEQ Response to EPA Comment 20

All planned retirements and fuel switches that have been relied upon by North Dakota are currently included in the proposed RH SIP revision⁵⁶ or have been included as federally enforceable requirements through other NDDEQ actions⁵⁷.

EPA Comment 21

Section 6, §51.308(f)(3) – Modeling of Long-Term Strategy to Set Reasonable Progress Goals. North Dakota appears to have set the reasonable progress goals (RPGs) for Lostwood Wilderness Area and Theodore Roosevelt National Park based on on-the-books control measures anticipated by 2028. However, the RPGs should be based on North Dakota's LTS, the LTSs of other states that may affect a Class I area, as well as other Clean Air Act requirements, which can be implemented by the end of the planning period. Guidance at 46-48; Clarifications Memo at 6. Even if North Dakota ultimately elects not to require additional control measures, the reported RPGs fail to reflect additional control measures in other states.

⁵⁴ See Table 1 at https://www.wrapair2.org/pdf/WRAP_OGWG_ARCS_Memo_23Mar2020.pdf

⁵⁵ See NDDEQ Response to EPA Comment 3, 4, and 5.

⁵⁶ Section 5.3.3.

⁵⁷ See NDDEQ Response to EPA Comment 2.

NDDEQ Response to EPA Comment 21

See Section 2 of the RH SIP revision for detailed explanation of how North Dakota used the several long-term strategies evaluated to set the reasonable progress goals.

North Dakota's reasonable progress goals reflect additional control measures in other states. The nearby states of South Dakota, Montana, and Wyoming also all set their reasonable progress goals based on the 2028 on-the-books emissions inventories utilized for the long-term strategy.⁵⁸ Of note, if any of these states achieve emissions reductions beyond their 2028 on-the-books inventory, this would only lower the projected visibility impairment for their state and North Dakota. In turn, this would result in even more progress being made than was anticipated, and the anticipated progress level was sufficient to show reasonable progress. The projected 2028 emissions inventory for Minnesota were based on EPA 2028v1 emissions estimates for the Non-WRAP EGU and the Non-WRAP non-EGU Point sectors⁵⁹. Note: EPA's projected 2028 emissions inventory for Minnesota may not include additional measures which could be under evaluation in Minnesota for Regional Haze.

EPA Comment 22

Section 6.1.1, Modeling of Additional Potential Controls and elsewhere. North Dakota argues that the costs of additional controls are not justified by the modeled visibility improvements, which the state characterizes as not being meaningful. For example, North Dakota asserts that the modeled visibility improvement of 0.1 dv at Lostwood Wilderness Area is insufficient to justify a combined capital cost of approximately \$150 million and a combined annualized cost of approximately \$30 million.⁶⁰ See our comment above regarding how states can properly consider visibility benefits as an optional additional factor in a four factor analysis.

NDDEQ Response to EPA Comment 22

See NDDEQ Response to EPA Comment 12 and NDDEQ Response to EPA Comment 16.

Additionally, NDDEQ evaluated what the modeled visibility improvement would be following the approach preferred by EPA as expressed in EPA Comment 23, see NDDEQ Response to EPA Comment 23.

EPA Comment 23

Section 6.1.1, Modeling of Additional Potential Controls and elsewhere. In Section 6.1.1 the state discusses modeling results for two potential additional control scenarios (PAC1 and PAC2) to evaluate "how sensitive is the model to the magnitude of reductions evaluated and will this meaningfully impact future visibility." Figure 46 shows the effects of the PAC1 and PAC2 emissions reductions on the modeled RPG in 2028 and compares the RPGs to the URP in 2028. This approach correctly shows the

⁵⁸ See <https://views.cira.colostate.edu/tssv2/Express/EmissionsTools.aspx>, Product #4 for the emissions inventory data. Compare 2028OTBa2 and 2028PAC2 for details on state evaluated emissions reductions.

⁵⁹ Appendix C.5-5.

⁶⁰ The costs noted are associated with potential additional controls at three facilities – Coyote Station, Antelope Valley Station, and Coal Creek Station – which would result in combined annual SO₂ and NO_x reductions of approximately 22,000 tons per year as reflected in Tables 18, 21, 23 of the draft SIP.

modeled visibility progress relative to polluted conditions in 2028; however, this is not the approach that EPA Guidance recommends for evaluating visibility benefits when making control strategy decisions. Because the 2028 conditions still include substantial anthropogenic impairment, the 2028 model RPGs underestimate the visibility benefits of the PAC1 and PAC2 scenarios compared to natural visibility conditions. On page 16 of the Guidance, EPA states:

A state should not evaluate the visibility impact of a source by only using a delta deciview value for which the current visibility condition, or the projected 2028 condition, is the “background” in the delta deciview calculation. The “background” value should be the light extinction due to natural sources only. EPA recommends the use of the natural condition values included in the December 2018 Technical Guidance on Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program as the background value.

Thus, when evaluating visibility changes in deciviews, an additional calculation is required to evaluate the visibility benefits of PAC1 and PAC2 relative to natural visibility conditions using this equation:

$$\text{Visibility improvement} = 10\ln(\text{PAC extinction} + \text{natural extinction})/10 - 10\ln(\text{natural extinction})/10$$

Where “PAC extinction” represents the change in light extinction in each of the PAC1 and PAC2 control scenarios, “natural extinction” represents the natural light extinction in inverse megameters at each Class I area, and “10” represents default Rayleigh scattering light extinction. A state may use the average of the daily visibility benefits on the 20 percent most anthropogenically impaired days as its visibility benefit metric. However, alternative metrics may be more appropriate when examining visibility impacts from individual sources. Modeled demonstrations that provide a single year of meteorological regimes at a given Class I area may not capture days over the broader multi-year period where a source may be contributing to visibility impairment. Depending on wind direction and other meteorological factors, emissions from a single source may not always or frequently impact a particular Class I area. But there may be individual day visibility impacts that may be important to consider. Therefore, for individual sources (such as Coyote and Antelope Valley), the maximum daily visibility impact on all days may be a more meaningful metric. A state may instead, or also, consider the maximum daily visibility benefit within the most impaired days or the values of visibility benefits on other days. Guidance at 15 and 35.

In summary, while the procedures used in the WRAP modeling for the RPG estimates in 2028 are consistent with EPA Guidance for comparing RPGs to the URP in 2028, additional analysis of day specific visibility benefits relative to natural visibility conditions is needed if the modeled visibility results are to be used to inform decisions about control strategies for specific facilities.

NDDEQ Response to EPA Comment 23

NDDEQ has evaluated visibility changes based on the several long-term strategies evaluated to set the reasonable progress goals, in deciviews, consistent with EPA’s recommendation. The following information presents the projected 2028 visibility conditions and delta deciview calculation with the “background” light extinction value only accounting for natural sources, and not a background with anthropogenic impairment.

NDDEQ applied the equation presented in EPA Comment 23 (see also NDDEQ Response to EPA Comment 12). To perform this calculation, the following table information was taken from Section 6.1.1 of the RH SIP Revision⁶¹:

Class I area	Natural Visibility	2028OTB	2028PAC2	2028PAC1	units
TRNP	5.94	13.56	13.53	13.48	deciviews
LWA	5.87	15.78	15.74	15.68	deciviews

Converting the deciviews presented in the table above to light extinction (Mm^{-1}) via $10e^{(\text{deciviews}/10)}$ yields the following:

Class I area	Natural extinction	2028OTB	2028PAC2	2028PAC1	units
TRNP	18.11	38.81	38.69	38.49	Mm^{-1}
LWA	17.99	48.48	48.26	47.95	Mm^{-1}

“PAC extinction” is then calculated as the light extinction differences from the above 2028 values, as following:

Class I area	2028OTB - 2028PAC2	2028OTB - 2028PAC1	2028PAC2 - 2028PAC1	units
TRNP	0.12	0.32	0.20	Mm^{-1}
LWA	0.21	0.52	0.31	Mm^{-1}

With “PAC extinction” calculated and natural visibility converted to Mm^{-1} , the corresponding “Visibility improvements” were calculated using EPA’s provided equation, as follows:

Class I area	2028OTB vs 2028PAC2	2028OTB vs 2028PAC1	2028PAC2 vs 2028PAC1	units
TRNP	0.07	0.17	0.11	deciviews
LWA	0.12	0.29	0.17	deciviews

The table above indicates, using EPA’s suggested calculation approach, the maximum projected delta deciview improvement to visibility on the most impaired days is 0.29 deciviews at LWA using Potential Additional Control scenario 1 (PAC1) over the baseline 2028 scenario (2028OTB). For TRNP, the maximum projected delta deciview improvement to visibility on the most impaired days is 0.17 deciviews. Evaluating the “delta deciview” calculation using EPA’s preferred approach does not materially change any conclusions presented by NDDEQ in the RH SIP revision. A 0.29 deciviews and 0.17 deciviews improvement for LWA and TRNP, respectively, remains below the threshold needed to be considered an improvement to anthropogenic visibility impairment.

EPA Region 8 confirmed that NDDEQ’s calculation of the visibility benefit relative to natural conditions is consistent with the equation EPA recommended in their comment letter.⁶²

⁶¹ Rounding may cause numbers to be slightly different.

⁶² Email from Gail Tonnesen (EPA R8) to David Stroh (NDDEQ) on June 28, 2022.

EPA Comment 24

Section 8, Coal Creek Station BART. As the proposed SIP revision includes a revised NO_x BART determination for Coal Creek Station, we request that North Dakota include a letter from the Governor withdrawing SIP Supplement No. 2 for Coal Creek Station which the state submitted to the EPA on January 2, 2013.

NDDEQ Response to EPA Comment 24

NDDEQ has included a letter from the Governor withdrawing SIP Supplement No. 2 for Coal Creek Station submitted to EPA on January 2, 2013. A replacement SIP addressing Coal Creek NO_x BART is included in Appendix F of this Regional Haze SIP revision.

EPA Comment 25

Equity and Environmental Justice. We encourage North Dakota to consider whether the SIP revision will result in equity and environmental justice impacts or impacts on any potentially affected communities. We also encourage North Dakota to describe any outreach to environmental justice communities that the state conducted, the opportunities North Dakota has provided for communities to give feedback on its proposed strategy, and the consideration North Dakota gave environmental justice in its technical analyses. See Clarifications Memo at 16.

NDDEQ Response to EPA Comment 25

The policy and practice of the NDDEQ is to provide an opportunity for fair and meaningful involvement to all persons regardless of race, color, national origin, or income, in the development, implementation, and enforcement of environmental laws, regulations, and policies under its authority.

NDDEQ reached out to its Tribal partners in North Dakota seeking to gather feedback on the RH SIP revision. NDDEQ, as explained in the RH SIP revision, engaged its Tribal partners during the federal land managers consultation period, and again during the public comment period. Since Tribal land in North Dakota is under the jurisdictional authority of EPA R8, NDDEQ believes that EPA R8 should also be engaging with the Tribal communities regarding regional haze and environmental justice. This is especially true given the significant oil and gas development on certain Tribal land in North Dakota.

As presented in the RH SIP revision, North Dakota is in attainment with all NAAQS. Therefore, all North Dakota citizens have the benefit of breathing clean air.

EPA Comment 26

Appendix A, Department Four-Factor Summaries. Throughout, for each of the selected sources, and for each emission unit evaluated, we recommend the appendix document and identify existing emission limits and where those limits are located (e.g., in the SIP, in a federal and/or state permit, in a consent decree). In addition, we recommend that it discuss how they compare to the baseline emissions used in the four-factor analyses. Some of this information is already contained in Tables 22 and 24 of Sections 4.2.1.1.1 and 4.2.1.1.2.

NDDEQ Response to EPA Comment 26

NDDEQ has provided adequate information regarding the selected sources emissions related information.⁶³ Each of the sources selected operates under a Clean Air Act Title V Operating Permit and each of those federally-enforceable permits are available on NDDEQ's website at:

<https://www.deq.nd.gov/ceris-ND/>. NDDEQ also believes sufficient information regarding the baseline emissions used in the four-factor analysis is already presented in the RH SIP revision. See NDDEQ Response to EPA Comment 7 for additional information.

EPA Comment 27

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. In Table 6 and throughout, specify the averaging period for the lb/MMBtu emission rates.

NDDEQ Response to EPA Comment 27

In response to EPA's comment, a footnote for Table 6 in Appendix F.1 was added to address the comment. The footnote indicates NDDEQ's basis for the emission rate associated with each control technology listed.

EPA Comment 28

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. For clarity, in Tables 6 and 7 and throughout, use "LNC3+ w/SNCR" or "LNC3+ w/SCR" where SNCR or SCR are evaluated in combination with LNC3+. This is consistent with how the control options are described in Table 8 and elsewhere.

NDDEQ Response to EPA Comment 28

In response to EPA's comment, Table 6 and Table 7 in Appendix F.1 have been updated to include "LNC3+ w/" to address the comment. NDDEQ agrees that this adds consistency with how the control options are described elsewhere in Appendix F.1.

EPA Comment 29

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. In Table 8, include the incremental cost-effectiveness of LNC3+ with SCR over LNC3+ with SNCR. It is given as \$12,200/ton at the bottom of page F.1-8.

NDDEQ Response to EPA Comment 29

In response to EPA's comment, Incremental cost of "LNC3+ w/SCR" over "LNC3+ w/SNCR" has been added to Table 8 in Appendix F.1. The discussion in Section 3.4.1 of Appendix F.1 was updated to reflect the changes made in Table 8. Incremental cost of "LNC3+ w/SCR" over "LNC3+ w/SNCR" was determined to be \$12,200 and \$21,600 per ton of NOx reduced at performance rates of 0.06 and 0.08 lb NOx per MMBtu, respectively.

⁶³ Appendix A.

EPA Comment 30

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. When discussing remaining useful life, specify the equipment life used for each control technology evaluated relative to the remaining useful life of the source.

NDDEQ Response to EPA Comment 30

In response to EPA's comment, Appendix F.1, Section 3.4.3 has been updated to include "For cost purposes, the lifetimes of the evaluated technologies are consistent with EPA defined defaults for SCR (30 years) and SNCR (20 years)." NDDEQ believes that from a financial perspective, amortizing the costs for 20 years would likely be the most appropriate given the recent significant (and expected future) changes to the coal EGU market share. This approach is also consistent with the evaluations performed on the other four-factor sources reviewed by NDDEQ for this implementation period of regional haze.

EPA Comment 31

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. When evaluating visibility impacts, we recommend that visibility impacts be presented and evaluated on a per unit basis in parallel to the per unit costs of compliance in section 3.4.1.

NDDEQ Response to EPA Comment 31

In response to EPA's comment, Appendix F.1, Section 3.5 has been updated to include "The maximum improvement in visibility is on a facility basis. Since Unit 1 and Unit 2 are identical units, individual (or per unit) visibility improvements can be determined by attributing half of the deciview improvement to each unit. For example, Model Scenario 1 in Table 12⁶⁴ for TRNP South Unit indicates a combined improvement of 1.30 deciviews (0.65 deciviews improvement from Unit 1 and 0.65 deciviews improvement from Unit 2)."

NDDEQ added the clarity above but did not change the tables in Section 3.5 of Appendix F.1. NDDEQ's rationale is as follows: any selected BART controls would apply to both Unit 1 and Unit 2, expressing the cumulative visibility benefit has the advantage of portraying the total modeled benefit of the controls evaluated from this facility. Simple math can be used to quantify the per unit visibility benefits and can also be used to determine incremental changes from one technology to another.

EPA Comment 31 (from January 13, 2022)

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2. When evaluating visibility impacts, we recommend that North Dakota base its BART determination on the year with the highest visibility improvement rather than the average of the three modeled years (2000-2002).

NDDEQ Response to EPA Comment 31 (from January 13, 2022)

In response to EPA's comment, NDDEQ has updated the SNCR and SCR summary bullets in Appendix F.1, Section 3.6 to illustrate the highest (or maximum) visibility benefit of all model years rather than the average visibility benefit of the three modeled years.

⁶⁴ Appendix F, page F.1-12.

Specifically, the bullets on visibility read as following:

- The highest visibility improvement of LNC3+ w/SNCR (over LNC3+ alone) is 0.07 deciviews.⁶⁵ This maximum modeled visibility improvement is extremely small and comes at a significant cost, over \$90,000,000 per 1 deciview of improvement.
- The highest visibility improvement of LNC3+ w/SCR (over LNC3+ alone) is 0.16 deciviews.⁶⁶ This maximum modeled visibility improvement is very small and comes at a significant cost, over \$110,000,000 per 1 deciview of improvement. Additionally, for the reasons outlined in Section 3.5 the expected actual visibility improvement will be smaller than presented herein.

EPA Comment 32

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2, page F.1-14 and F.1-15. In addition to incremental cost-effectiveness, discuss whether the state finds the average cost-effectiveness for each control option reasonable. Specifically, describe whether the average cost-effectiveness of each of the control options is considered reasonable relative to any cost thresholds previously used by the state (when adjusted for inflation).

NDDEQ Response to EPA Comment 32

The cost reasonableness of each additional control options reviewed is already included in Section 3.4.1 of Appendix F.1. When NDDEQ believes relevant, the average cost of compliance is discussed. In others, incremental cost of compliance is discussed. NDDEQ explained the rationale for presenting the costs in each situation.

NOx BART determinations were made by NDDEQ on a case-by-case basis in consideration of the BART guidelines and the presumptive NOx BART emission limits established by EPA. CAA §169A requires states to consider: the costs of compliance, the energy and non-air quality environmental impacts of compliance, any existing pollution control technology in use at the source, the remaining useful life of the source, and the degree of visibility improvement which may reasonably be anticipated from the use of BART. Each of these factors was considered by NDDEQ as detailed in Appendix F.1.

EPA Comment 33

Appendix F.1, NOX BART analysis for Coal Creek Station Unit 1 and Unit 2, page F.1-15. Consistent with the BART Guidelines, specify the incremental cost-effectiveness of LNC3+ with SCR relative to the next most stringent control option, LNC3+ with SNCR.

⁶⁵ 0.07 deciviews is calculated from $(0.37-0.23)/2$, see Table 14 Model Scenario 3 and 4 for TRNP South Unit, Appendix F.1.

⁶⁶ 0.16 deciviews is calculated from $(0.55-0.23)/2$, see Table 14 Model Scenario 3 and 6 for TRNP South Unit, Appendix F.1.

NDDEQ Response to EPA Comment 33

In response to EPA's comment, NDDEQ has added a SCR summary bullet in Appendix F.1, Section 3.6 which states: "Not cost feasible with incremental costs ranging from of \$12,200–\$21,600 per ton of NO_x reduced relative to LNC3+ with SNCR (See Table 8)." ⁶⁷

NDDEQ Response to National Park Service (Appendix D.6-312)

Thank you for your comments. **PLEASE CONSIDER:** NDDEQ recommends that the National Park Service (NPS) provide future comments following EPA's Tips for Effective Comments (<https://www.epa.gov/dockets/commenting-epa-dockets>). Doing this allows NDDEQ to respond to the concerns of the commentor effectively and efficiently.

Introduction and Background for NDDEQ's Response to NPS Comments

The National Park Service (NPS) submitted two sets of comments, one during the FLM consultation period (November 19, 2021) and one during the public comment period (June 1, 2022). Feedback submitted during FLM consultation can be found in Appendix D.2.a. and NDDEQ's responses are found in Appendix D.2.c. Complete NPS comments received during the public comment period can be found at Appendix D.6-312. Notably, the June NPS comments did not significantly engage in the NDDEQ response (provided in Appendix D.2.c.). NDDEQ stands by the response to those comments. NDDEQ responds to additional comments from NPS in the following sections. NDDEQ grouped NPS comments into categories, like the responses provided in Appendix D.2.c.

NPS first compliments NDDEQ on the technical accuracy of the four-factor analyses. NDDEQ appreciates that characterization as we have worked diligently to complete our RH SIP. However, NPS then goes on to comment that NDDEQ should 'do more' regarding the RH SIP revision. These comments misunderstand NDDEQ's authority, role, and responsibility under the Clean Air Act's regional haze program. Asserting that NDDEQ might be able to 'do more' does not mean that NDDEQ's plan fails to meet the Clean Air Act or Regional Haze Rule obligations. The statute and regulations establish the factors that NDDEQ must consider and the authority and discretion it may exercise to protect and improve visibility, and it cannot arbitrarily impose burdens on its citizens. The plan set forth by NDDEQ reflects a proper exercise of its authority, accomplishing the goal to protect and improve visibility.

Response to sections titled "Cover Letter and 1 Executive Summary"

NDDEQ believes it has sufficiently addressed NPS feedback received on November 19, 2021, with the explanatory additions made to the RH SIP revision between the FLM consultation draft and the public comment draft. These additions provided a more detailed articulation of the RH SIP revision developmental process and considerations made by NDDEQ.

NPS requested NDDEQ address comments provided on November 2021, directed at the Great Plains Synfuels Plant, the Tioga and Little Knife Gas Plants and the Northern Border Pipeline Compressor Station No. 4. NPS did not provide specific comments on these facilities, but did provide information on

⁶⁷ Appendix F, page F.1-15

what they would have considered if they had performed a review on these facilities.⁶⁸ Generally, NPS' comments focused on cost. NDDEQ review found these cost estimates to be low and that the "cost-effective" results presented by NPS are not accurate, see Appendix D.2.c-7. Additionally, these adjustments would have no material impact on the final conclusions reached within the RH SIP revision. See NDDEQ Response to EPA Comment 1 and NDDEQ Response to EPA Comment 12 regarding visibility and cost-effectiveness.

NPS states that "North Dakota has the biggest influence on haze in NPS Class I areas based on a cumulative analysis of surrogate visibility impacts (emissions/distance)." This quote misinterprets the significance of the surrogate visibility impacts. The cumulative analysis of surrogate visibility impacts referred to by NPS is known as a Q/d screening analysis, where 'Q' is emissions of visibility impairing species, in tons, and 'd' is distance from the emissions source to the Class I area, in kilometers. A Q/d screening analysis is used to preliminarily screen large stationary point sources to determine which of these sources have the potential to impair visibility in a given Class I area. The sources with the largest potential are then selected for additional review (i.e., the required four-factor analysis). A Q/d analysis is only useful as a high-level screening tool and cannot be used to determine actual visibility impacts from any given source or industry.⁶⁹

Lastly, in the executive summary, NPS expresses support for many of the comments provided by EPA. Responses to EPA comments can be found in NDDEQ Response to U.S Environmental Protection Agency (Appendix D.6-583).

Response to section titled "2 Response to Public Review Draft SIP"

As a response to NPS' cost-effectiveness comments, NDDEQ stands by its previous response provided to NPS in Appendix D.2.c. Additionally, please refer to NDDEQ Response to EPA Comment 1 and NDDEQ Response to EPA Comment 12. North Dakota has also addressed NPS comments regarding the four factor considerations in Section 5.2 and subsection of the RH SIP revision.

NPS expresses concerns over NDDEQ 'summarily' dismissing "otherwise reasonable controls identified in the four factor analyses" and "cost-effective" controls, see NDDEQ Response to EPA Comment 12.

NPS notes the CAMx model performance underpredictions. NDDEQ addressed model performance in the RH SIP revision, as covered in Appendix C.1. This information has remained unchanged since the FLM consultation process began.

NDDEQ believes the additional information provided by NPS regarding SCR on North Dakota lignite only strengthens NDDEQ's position on SCR in North Dakota. For example, NPS makes a statement that *"the lack of SCR application and/or testing does not make the technology technically infeasible"*. This directly contradicts the discussion of what constitutes a "technically feasible" option in Appendix Y to Part 51 -

⁶⁸ NPS fails to recognize that NDDEQ has imposed measures on the Tioga Gas Plant to reduce NOx emissions from the units which NPS would like to see controls on, see Appendix A.8.

⁶⁹ Available at: <http://npshistory.com/publications/air-quality/flag-2010.pdf>

Guidelines for BART Determinations Under the Regional Haze Rule. NDDEQ stands by the response provided to NPS in Appendix D.3.c.

NDDEQ stands by the response provided in Appendix D.2.c to NPS regarding the incorrect cost corrections provided by NPS and provided additional response to this subject in NDDEQ Response to EPA Comment 13. Additionally, NDDEQ received detailed information from Sargent & Lundy defending the cost information provided in Appendix B and corroborates the information provided in Appendix D.2.c.^{70,71}

NPS provided recommendations regarding Oil and Gas. See NDDEQ Response to EPA Comment 19 regarding NO_x emissions from upstream oil and gas. NDDEQ recognizes that some states may have more stringent NO_x standard requirements for engines. However, that does not mean that it is appropriate for North Dakota to implement these standards. Other state engine NO_x standards likely resulted from NO_x or Ozone non-attainment issues. North Dakota is in attainment with all air quality standards, as expressed in the RH SIP revision.

[Response to section titled “3 Specific Review of Four-Factor Analyses -Coyote Station Update”](#)
Comments provided by NPS during the FLM consultation have already been addressed by NDDEQ in the Appendix D.2.c. These were provided based on the FLM feedback received during the consultation period. No additional material of significance was presented by NPS in the June 1, 2022, comments.

In addition, the Coyote Station ownership group has provided comments on NDDEQ’s RH SIP revision, See Coyote Station Owners Comments at Appendix D.6-313. As stated in NDDEQ Response to Coyote Station Owners (Appendix D.6-313), NDDEQ supports the information provided in Attachment 1. Attachment 1 contains detailed information regarding the Coyote cost analyses performed by Sargent & Lundy. These responses corroborate NDDEQ’s response in Appendix D.2.c. In addition, the responses further support the accuracy of the cost analyses. Given the detailed response provided by Sargent & Lundy and the FLM feedback response provided by NDDEQ in Appendix D.2.c, NDDEQ disagrees with NPS specific “cost corrections” comments. See NDDEQ Response to EPA Comment 1 and NDDEQ Response to EPA Comment 12.

Please note, various comments were provided containing factual errors. For example, in the “National Park Service (NPS) Regional Haze SIP feedback for the North Dakota, Department of Environmental Quality (NDDEQ)” document at Appendix D.6-312, specifically comment page 27 and 28, NPS references ‘Basin’ several times as the owner of Coyote Station and appears to confuse Milton R. Young Station (MRYS) with Coyote Station. NPS also includes details on Antelope Valley Station, a Basin owned facility, in its discussion of Coyote Station. Basin has no affiliation with Coyote Station, and when MRYS is mentioned, it appears to be unrelated to the situation.

⁷⁰ Appendix D.6-313. Attachment 1: Sargent & Lundy, North Dakota Round II Regional Haze State Implementation Plan Determination’s Four-Factor Analysis for Coyote Station; Response to National Park Service Air Resources Division Comments (May 31, 2022).

⁷¹ Appendix D.6-311 contains Basin Comments. Sargent & Lundy response is titled “20220602_BASIN ELECTRIC POWER COOPERATIVE.pdf” and can be found in the attachments to the Appendix D.6 comments.

NDDEQ Response to National Parks Conservation Association, Sierra Club, Badlands Conservation Alliance (Appendix D.6-5 — D.6-8)

Introduction and Background for NDDEQ's Response to "Conservation Organizations"

Thank you for your comments. The National Parks Conservation Association, Sierra Club, and Badlands Conservation Alliance (Conservation Organizations) submitted an immense amount of material presented as "comments" on North Dakota's RH SIP revision. The materials submitted were comprised of a main "comments" document, eight exhibits, and 24 spreadsheets.

PLEASE CONSIDER. NDDEQ recommends that the Conservation Organizations provide future comments following EPA's Tips for Effective Comments (<https://www.epa.gov/dockets/commenting-epa-dockets>). Doing this allows NDDEQ to respond to the concerns of the commentor effectively and efficiently. The comments provided by the Conservation Organizations includes outdated information, provides limited legal support for their claims, and is frequently repetitive.

It appears that Conservation Organizations commented upon the draft RH SIP revision available for **FLM Consultation** and **not** the RH SIP revision available for **public comment**. The Conservation Organizations' comments referenced quotes from a draft of NDDEQ's RH SIP revision which no longer exists, as changes were made post FLM consultation. NDDEQ changed the text quoted by the Conservation Organizations prior to making the plan available for public review and comment. Therefore, NDDEQ does not believe the Conservation Organizations reviewed the most recent draft version that was made available to the public. Since the Conservation Organization reviewed an outdated version of the draft RH SIP revision, some of the comments are no longer pertinent.

Upon NDDEQ's review of all the material provided, the Conservation Organization identified 12 specific concerns. NDDEQ reviewed these in detail and provides the following responses.

Response to Conservation Organizations Comment "1. DEQ has not adequately documented key data that underlies its SIP proposal, and failed to independently evaluate the availability of cost-effective controls for North Dakota sources."

NDDEQ has appropriately documented the key data relied upon during the development of the RH SIP revision. This NPCA comment directly contradicts major statements provided by the NPS and the USFS during the FLM consultation phase. These two federal government entities, with key roles in the RH SIP development process, complimented NDDEQ on the technically sound information provided in the SIP.^{72,73} EPA also found the data presented by NDDEQ to be adequate since no comments regarding the merits of the data provided were raised and EPA is the lead federal agency responsible to review and to act upon the RH SIP revision.

See NDDEQ Response to EPA Comment 12 regarding "cost-effective controls". See Appendix A regarding North Dakota's independent evaluation of the four-factors. Further, the communications correspondence in Appendix B.1.c though B.10.c shows that NDDEQ did not "simply accept" the reports

⁷² Appendix D.2.b-2.

⁷³ Appendix D.2.a-8.

provided by the sources. Instead, NDDEQ completed an independent and thorough review of the information.

Response to Conservation Organizations Comment “2. DEQ impermissibly exempts EGUs and non-EGUs from further control analysis based on the state’s purported compliance with the Uniform Rate of Progress.”

NDDEQ did not exempt any identified source from an analysis of additional potential controls measures. NDDEQ selected sources (the same sources the NPS recommended⁷⁴, plus an additional source) for further control analysis based on the information outlined in Section 5.2 and Appendix C of the RH SIP revision. These analyses are independent of a state’s position regarding the uniform rate of progress, see NDDEQ Response to EPA Comment 9, NDDEQ Response to EPA Comment 16 and NDDEQ Response to EPA Comment 17.

Response to Conservation Organizations Comment “3. DEQ impermissibly exempts EGUs from technically feasible, cost-effective controls based on the purportedly insignificant modeled visibility benefits associated with individual source controls.”

See NDDEQ Response to EPA Comment 1 and NDDEQ Response to EPA Comment 12 regarding visibility and cost-effective controls.

Response to Conservation Organizations Comment “4. DEQ erroneously and impermissibly relies on unenforceable emission reductions to avoid further control analyses for North Dakota sources.”

NDDEQ did not rely on any unenforceable emissions reductions to avoid further controls analysis. See NDDEQ Response to EPA Comment 2 and NDDEQ Response to EPA Comment 10 regarding enforceable requirements included in the RH SIP revision. Additionally, refer to Section 5.2 and Appendix A of the RH SIP revision. NDDEQ outlines the analyses of additional controls for the North Dakota sources selected for review in these sections.

Response to Conservation Organizations Comment “5. DEQ improperly relies on on-the-books Clean Air Act programs to sidestep cost effective controls.”

See NDDEQ Response to EPA Comment 12 regarding cost-effective controls.

Response to Conservation Organizations Comment “6. DEQ arbitrarily concludes that selective catalytic reduction technology is technically infeasible for lignite-burning electric generating units, and fails to mention or evaluate extensive, updated technological data in the record demonstrating that SCR is feasible across lignite EGUs.”

Adequate data, both technical and economical, has been included in the RH SIP revision, see Appendix A and Appendix B. Additionally, NDDEQ addressed this in response to FLM feedback at Appendix D.2.c-4 “Technical feasibility of SCR on all boiler types”. No information has been provided indicating SCR has

⁷⁴ Appendix E.2-7 through E.2-11

been demonstrated in practice on North Dakota lignite fired boilers, which is a mandatory requirement before a technology can be considered technically feasible.

Response to Conservation Organizations Comment “7. DEQ arbitrarily and impermissibly fails to identify cost-effectiveness thresholds for reasonable progress controls.”

See NDDEQ Response to EPA Comment 1 and NDDEQ Response to EPA Comment 12 regarding visibility and cost-effective controls. Additionally, see Appendix D.2.c-1 for NDDEQ’s response to NPS’s request received during the FLM consultation to establish a cost threshold.

Response to Conservation Organizations Comment “8. DEQ’s control evaluation for the state’s EGU sector—the Coyote, Coal Creek, Milton Young, Antelope Valley, and Leyland Olds power plants, in particular—relies on numerous unsupported or erroneous cost assumptions, and fails to satisfy the Regional Haze Rule’s requirement that the state include the “robust” technical demonstration showing that no additional controls are reasonable.”

See NDDEQ Response to EPA Comment 13 which addressed the cost assumptions included in NDDEQ’s RH SIP revision.

North Dakota established reasonable progress goals for the most impaired days that provides for an adequate rate of visibility improvement during this planning period. This negates the need to fulfill the ‘robust demonstration’ requirements of 40 CFR 51.308(f)(3)(ii)(A), see Section 6.2 of the RH SIP revision.

Additionally, during the required communications outreach North Dakota received no recommendations from neighboring states requesting additional controls on sources in North Dakota potentially contributing to visibility impairment in their Class I areas. This negates the need to fulfill the ‘robust demonstration’ requirements of 40 CFR 51.308(f)(3)(ii)(B), see Section 6.3 of the RH SIP revision.

Response to Conservation Organizations Comment “9. The Proposed SIP fails to properly evaluate the statutory reasonable progress factors for the non-EGU sources (Little Knife Gas Plant, Hess Tioga Gas Plant, Northern Border Pipeline Compressor Station No. 4, Great Plains Synfuels Plant) and instead refuses to impose any additional controls based on erroneous and unsupported cost assumptions, unenforceable equipment life assumptions, erroneous emission baseline figures, undocumented interest rates, too low plant efficiencies, and inappropriate inclusion of sales tax.”

See NDDEQ’s NDDEQ Response to EPA Comment 13, NDDEQ Response to EPA Comment 14, and NDDEQ Response to EPA Comment 15. See NDDEQ’s response to the NPS at Appendix D.2.c-7 “Response to Reasonable Progress Cost of Compliance and Inflated Costs of North Dakota’s Four Factor Analyses”. Additionally, NDDEQ notes, as included in RH SIP revision in Appendix A.8, additional enforceable measures have been required for the Hess Tioga Gas Plant.

Response to Conservation Organizations Comment “10. DEQ fails to – and must – conduct Four-Factor Analyses and require emission limitations on the oil and gas sector sources.”

NDDEQ has properly documented the considerations evaluated for the oil and gas sector in North Dakota. NDDEQ provided reference and a link to an “Additional Reasonable Control Strategies for Oil and Gas Emission Sources in the WESTAR-WRAP region”, see Section 5.2.11 of the RH SIP revision. NDDEQ also sufficiently explained the rationale regarding the conclusions reached for this sector in the Section 5.2.11. See NDDEQ Response to EPA Comment 18 and NDDEQ Response to EPA Comment 19 for more information.

Response to Conservation Organizations Comment “11. DEQ’s treatment of the Regional Haze Rule’s consultation requirement in Section 51.308(f)(2)(ii) is entirely perfunctory and does not satisfy the rule’s requirements.”

NDDEQ prioritized consultations and has documented the significant communications with neighboring states. See Section 2.1 of the RH SIP revision. NDDEQ communicated regularly with most WRAP states and periodically with Minnesota.

NDDEQ also included the emails which first formally requested feedback from South Dakota⁷⁵, Montana⁷⁶, and Minnesota⁷⁷ regarding the state-to-state consultation requirements in Appendix E. These emails were sent in June 2021. Also as listed in Appendix E, North Dakota held informal coordination with Montana beginning in May/June 2019⁷⁸ and initiated communications with Minnesota in November 2019⁷⁹.

Response to Conservation Organizations Comment “12. DEQ fails to evaluate the impacts of the proposed SIP on environmental justice and historically disadvantaged tribal communities.”

See NDDEQ Response to EPA Comment 25.

NDDEQ Response to Public Service Commission (Appendix D.6-9)

Thank you for the comments in support of the North Dakota RH SIP revision. NDDEQ agrees with the concerns expressed by the Public Service Commission. The North Dakota Public Service Commission comments are centered around the following categories: ongoing changes in the energy industry, the importance of maintaining grid reliability, the 2022 summer grid reliability assessment (primarily MISO), and the risk of additional regulatory costs forcing early retirements or significant financial impacts to utility rate payers. Many of these concerns are not explicitly addressed in NDDEQ’s RH SIP revision, as the RH SIP revision primarily focusses on visibility and what may be needed to improve visibility conditions to keep pace with the goals of Clean Air Act 169A. However, the concerns raised by the Public Service Commission are major items of importance to the citizens of North Dakota.

⁷⁶ Appendix E.2-103 and E.2-104

⁷⁷ Appendix E.2-106 and E.2-107

⁷⁸ Appendix E.2-1 through E.2-5

⁷⁹ Appendix E.2-24 and E.2-25

NDDEQ Response to Basin Electric (Appendix D.6-311)

Thank you for the comments and overall support for North Dakota's RH SIP revision. NDDEQ has reviewed and considered the comments and requests provided by Basin. NDDEQ believes all the information necessary to defend North Dakota's RH SIP revision considerations and conclusions are already adequately included in the RH SIP revision. Therefore, additional specificity, clarification, and/or demonstration is unnecessary.

NDDEQ has thoroughly reviewed the Attachment provided by Basin "*North Dakota Round II Regional Haze State Implementation Plan Determination's Four-Factor Analysis for Antelope Valley and Leland Olds Stations Response to National Park Service Air Resources Division Comments*". The information provided within this attachment substantiates the data, information, and responses provided by NDDEQ to the NPS in Appendix D.2.c and is hereby incorporated as additional support for the materials utilized by NDDEQ in preparation of the RH SIP revision.

NDDEQ Response to Coyote Station Owners (Appendix D.6-313)

Thank you for the comments and overall support for North Dakota's RH SIP revision. NDDEQ has reviewed and considered the comments and requests provided by Coyote Station Owners. NDDEQ believes all the information necessary to defend North Dakota's RH SIP revision considerations and conclusions are already adequately included in the RH SIP revision. Therefore, additional specificity, clarification, and/or demonstration is unnecessary.

NDDEQ has thoroughly reviewed the Attachment provided by Coyote Station Owners "*Attachment 1 Sargent & Lundy, North Dakota Round II Regional Haze State Implementation Plan Determination's Four-Factor Analysis for Coyote Station; Response to National Park Service Air Resources Division Comments (May 31, 2022)*" of "*Comments of the Co-Owners of the Coyote Station on the North Dakota State Implementation Plan for Regional Haze:*" The information provided within this attachment substantiates the data, information, and responses provided by NDDEQ to the NPS in Appendix D.2.c and is hereby incorporated as additional support for the materials utilized by NDDEQ in preparation of the RH SIP revision.

NDDEQ Response to Minnkota Power Cooperative, Inc. (Appendix D.6-316)

Thank you for the comments and overall support for North Dakota's RH SIP revision. NDDEQ has reviewed and considered the comments and requests provided by Minnkota Power. NDDEQ believes all the information pertinent to defend North Dakota's RH SIP revision considerations and conclusions is already adequately included in the RH SIP revision.

NDDEQ Response to Lignite Energy Council (Appendix D.6-589)

Thank you for the comments and overall support for North Dakota's RH SIP revision. NDDEQ has reviewed and considered the comments and requests provided by the Lignite Energy Council. As a result, NDDEQ provides the following responses:

- NDDEQ considered the request by LEC to make a clear statement regarding the date of effectiveness of the RH SIP revision. N.D. Cent. Code Ann. § 23.1-06-16 already contains

provisions indicating the date of effectiveness is dependent upon EPA approval of the RH SIP revision.

- LEC requested NDDEQ compare visibility improvement to a ‘natural background’ versus a ‘degraded background’ and recommended following EPA’s provided methodology. NDDEQ evaluated the visibility improvements following this methodology and presents this information in NDDEQ Response to EPA Comment 23.
- LEC recommendation for visibility-based cost-effective metric. See NDDEQ Response to EPA Comment 12.

[NDDEQ Response to Coal Conversion Counties Association \(Appendix D.6-2\)](#)

NDDEQ agrees with the importance of maintaining a reliable electrical grid and imposing additional costs on baseload generating plants is inappropriate given current market circumstances. While these concerns are outside the scope of visibility, they are major items of importance and should not be overlooked. Thank you for the comment in support of North Dakota’s RH SIP revision.

[NDDEQ Response to North Dakota Petroleum Council \(Appendix D.6-591\)](#)

Thank you for the comment in support of North Dakota’s RH SIP revision.

[NDDEQ Response to NACCO Natural Resources \(Appendix D.6-4\)](#)

Thank you for the comments and overall support for North Dakota’s RH SIP revision. NDDEQ has reviewed and considered the comments and requests provided by NACCO Natural Resources. NDDEQ believes all the information pertinent to defend North Dakota’s RH SIP revision considerations and conclusions is already adequately included in the RH SIP revision.

[NDDEQ Response to Western Dakota Energy Association \(Appendix D.6-590\)](#)

Thank you for the support for the North Dakota Regional Haze State Implementation Plan revision. NDDEQ agrees with your concerns expressed regarding baseload generating plants, national reliability organizations warnings on regional electric grids stability, and current market conditions. Many of these concerns are not explicitly addressed in NDDEQ’s RH SIP revision, as the RH SIP revision primarily focusses on visibility and what may be needed to improve visibility conditions to keep pace with the goals of Clean Air Act 169A. However, the concerns raised by the Western Dakota Energy Association are major items of importance to the citizens of North Dakota.

[NDDEQ Response to North Dakota Farm Bureau \(Appendix D.6-562\)](#)

Thank you for the support for the North Dakota Regional Haze State Implementation Plan revision.

[NDDEQ Response to Clean Up the River Environment \(Appendix D.6-586\)](#)

Thank you for the comments. NDDEQ addressed the concerns expressed by CURE in prior comment responses, please refer to NDDEQ Response to U.S Environmental Protection Agency (Appendix D.6-583), NDDEQ Response to National Park Service (Appendix D.6-312), and NDDEQ Response to National Parks Conservation Association, Sierra Club, Badlands Conservation Alliance (Appendix D.6-5 — D.6-8).

NDDEQ Response to Public Hearing Comments (Appendix D.3.f)

Four individuals provided oral testimony during the public hearing. The complete transcript of the oral testimony can be found in Appendix D.3.f. Testimony was provided by: Jonathan Fortner, Prairie Rose Seminole, Tracy Potter, and Elizabeth Loos.

NDDEQ Response to Jonathan Fortner

Jonathan Fortner, representing the Lignite Energy Council (LEC), provided a summary of the written comments submitted on behalf of LEC on June 1, 2022.

NDDEQ has completed review and consideration of the LEC comments and has provided written responses in NDDEQ Response to Lignite Energy Council (Appendix D.6-589).

Thank you for the comments.

NDDEQ Response to Prairie Rose Seminole

Prairie Rose Seminole, member of the three affiliated tribes, provided testimony encouraging the NDDEQ to take more action on reducing emissions and providing her opinion that the current plan will not comply with the Clean Air Act and the Regional Haze Rule.

There was no technical information provided to support the statement that NDDEQ is not complying with the Clean Air Act or the rules promulgated thereunder. NDDEQ believes it has put forth a plan that will reduce emissions, protect visibility, and enhance air quality throughout North Dakota and meets the statutory obligations of both the Clean Air Act and the Regional Haze Rule.

Thank you for the comments.

NDDEQ Response to Tracy Potter

Tracy Potter, senator for district 35 in Bismarck, provided testimony requesting NDDEQ take more action than currently proposed in the RH SIP revision. Tracy Potter indicated that the situation we are in is not about just visibility, but it is about cleaner air. Tracy Potter would like legislative action where the state could help pay for investments to improve coal plants and reduce flaring.

Like the above response, there was no technical argument provided indicating how NDDEQ's plan fails to comply with the Clean Air Act or the Regional Haze Rule as a reason North Dakota should take more action than currently proposed.

NDDEQ disagrees with this commentor's concern regarding the situation we are in; regional haze pertains to visibility. The National Ambient Air Quality Standards, which North Dakota is in full compliance with, is about health- and environment-based standards. These are separate programs. That said, if North Dakota, like too many other states in the nation, was in non-attainment for health-based air quality standards, integrated planning could be utilized to tackle both problems concurrently. Fortunately, North Dakota maintains some of the cleanest air in the nation and does not have this problem.

Thank you for the comments.

[NDDEQ Response to Elizabeth Loos](#)

Elizabeth Loos, executive director of Badlands Conservation Alliance, provided testimony ultimately requesting North Dakota ‘do more’ when it comes to reducing emissions and improving visibility. Elizabeth Loos makes the claim that NDDEQ fails to reduce pollution and meet the standards set but provides no technical argument indicating how NDDEQ’s plan fails to comply with the Clean Air Act or the Regional Haze Rule. NDDEQ believes it has put forth a plan that will reduce emissions, protect visibility, and enhance air quality throughout North Dakota and meets the statutory obligations of both the Clean Air Act and the Regional Haze Rule.

Of note, the Badlands Conservation Alliance provided comments with the National Parks Conservation Association and the Sierra Club, which have been addressed in NDDEQ Response to National Parks Conservation Association, Sierra Club, Badlands Conservation Alliance (Appendix D.6-5 — D.6-8).

Thank you for the comments.

[NDDEQ Response to General Public Comments \(Appendix D.6-1, D.6-3, D.6-349, D.6-580, D.6-592\)](#)

Thank you for your interest in air quality and the North Dakota Regional Haze State Implementation Plan revision. None of the commenters provided technical information showing how NDDEQ is not complying with the Clean Air Act or the rules promulgated thereunder.

[NDDEQ Response to General Public Comments \(Appendix D.6-318\)](#)

Thank you for your interest in air quality and the North Dakota Regional Haze State Implementation Plan revision. The Belfield Gas Plant (formerly owned by Whiting, now owned by Andeavor Field Services, LLC) was not considered for review due to the low emissions of visibility impairing pollutants. The Belfield Gas Plant recent emissions inventories indicate an average of less than 30 tons per year of nitrogen oxides and less than 5 tons per year sulfur dioxides. Similarly, if the Davis Refinery completes construction, it will emit up to 40 tons per year of nitrogen oxides and 13 tons per year of sulfur dioxide, low amounts of visibility impairing pollutants. Coal Creek Station has been taken into consideration as detailed in the RH SIP revision.

[NDDEQ Response to “Protect North Dakota's parks from haze pollution”, General Public \(Appendix D.6-10 — D.6-310\)](#)

Thank you for the comments provided on North Dakota’s RH SIP revision. None of these commenters provided technical information supporting the statements that NDDEQ is not complying with the Clean Air Act or the rules promulgated thereunder. NDDEQ stands by its decision and addresses the three requests identified by the commentors as follows:

The RH SIP revision includes new and existing measures relied upon by NDDEQ for the selected coal fired EGUs and oil and gas point sources, as explained in NDDEQ Response to EPA Comment 2 and NDDEQ Response to EPA Comment 10. Beyond these measures, cost-effective controls are further discussed in NDDEQ Response to EPA Comment 12.

Additionally, NDDEQ has properly documented the considerations evaluated for the non-point oil and gas sector in North Dakota and has sufficiently explained its rationale regarding the conclusions reached for this sector in Section 5.2.11 of the RH SIP revision. NDDEQ Response to EPA Comment 18 and NDDEQ Response to EPA Comment 19 further elaborate on NDDEQ's analysis of this sector.

NDDEQ consideration of Environmental Justice is discussed in NDDEQ Response to EPA Comment 25.

[NDDEQ Response to General "Regional Haze Public Comments" \(Appendix D.6-314, D.6-315, D.6-317, D.6-319 — D.6-348, D.6-350 — D.6-561, D.6-563 — D.6-579, D.6-581, D.6-582, D.6-584, D.6-585, D.6-587, D.6-588\)](#)

Thank you for the comment in support of North Dakota's RH SIP revision.

[NDDEQ Response to "Revise the Regional Haze Plan and require cost-effective pollution controls to protect our national parks" \(Appendix D.6-594 — D.6-678\)](#)

Thank you for the comments provided on North Dakota's RH SIP revision. None of the commenters provided technical information supporting the statements that NDDEQ is not complying with the Clean Air Act or the rules promulgated thereunder. NDDEQ stands by its decision and addresses the four requests identified by the commentors as follows:

The RH SIP revision includes new and existing measures relied upon by NDDEQ as explained in NDDEQ Response to EPA Comment 2 and NDDEQ Response to EPA Comment 10. Beyond these measures, cost-effective controls are further discussed in NDDEQ Response to EPA Comment 12.

NDDEQ addressed the establishment of a cost-effectiveness threshold in response to FLM feedback at Appendix D.2.c-1 "Establishment of a Cost Threshold".

NDDEQ has provided sufficient information in Appendix B of the proposed RH SIP revision to support the cost information utilized by NDDEQ. This is further addressed in NDDEQ Response to EPA Comment 13.

NDDEQ consideration of Environmental Justice is discussed in NDDEQ Response to EPA Comment 25.

Lastly, NDDEQ agrees that poor air quality is detrimental to the health and enjoyment of those visiting our national parks, which is why North Dakota takes pride in having some of the cleanest air in the country. NDDEQ believes this RH SIP revision will further improve air quality and continue to protect the public health and welfare with the proposed measures included in the RH SIP revision.

D.6 – Comments Received During the Public Comment Period

Note: Numerous Appendix D.6 comments contains attachments which can be accessed directly through this pdf.

For Example, Page D.6-2 contains an attachment from Coal Conversion Counties. To access this attachment, simply double click on the “**Attachments:**” hyperlink to open.

Why wouldn't N.D. do everything possible to limit pollution. Climate change needs to be a priority for the health, welfare and very existence of future generations. We need to do everything possible to preserve our planet & if it means standing up to "big oil" & coal so be it. If we have the technology to institute additional emissions controls - it is irresponsible not to do so.

The increased number of oil wells around our national parks are not pleasing to a once beautiful area & I don't understand how we gave in to the demands of those being driven by financial gain at the expense of our future.

Perhaps if we did something about climate change there would not be so many wild fires in the forests of the world.

Sincerely,
L. Lunderson

I live in northeast South Dakota, about 10 miles from the North Dakota border, and I'm just about fed up with all the pollution, smoke and haze coming from all your fossil fuel burning facilities! I shouldn't have to put up with it! This is MY life and you've ruined it by making me sick from all your goddam pollution! I'm speaking up for all the children and grandchildren who are suffering right now from your pathetic negligence. David Stroh, you could quite possibly be the stupidest motherfucker, based on your kooky and moronic comments in the Fargo Forum. No more goddam coal power plants! I don't care how many jobs it supports, go find something else. The taxpayers should never be on the hook for subsidies to coal. You people will face your judgement day, and it looks like you'll be headed to the deep south.

Good evening,

On behalf of National Parks Conservation Association (“NPCA”), Sierra Club, and Badlands Conservation Alliance (“Conservation Organizations”), please accept the attached legal comments on North Dakota Department of Environmental Quality’s (“DEQ’s”) Draft State Implementation Plan (“SIP”) for Regional Haze for the Second Planning Period.

In addition to the five technical reports and 24 Excel spreadsheets attached and referenced in our earlier June 1, 2022 email, we also submit the attached exhibits in support of the comments:

- Assessment of Cost Effectiveness Analyses for Controls Evaluated Four – Factor Analyses for Oil and Gas Facilities for the New Mexico Environment Department’s Regional Haze Plan for the Second Implementation Period, prepared by Vicki Stamper and Megan Williams, dated July 2, 2020, attached as Ex. 6.
- Trinity Consultant, Regional Haze Four-Factor Analysis, U. S. Steel – Mon Valley Works Clairton Plant, dated Oct. 29, 2020, attached as Ex. 7.
- Comments on the Proposed Approval of North Dakota Regional Haze State Implementation Plan for Regional Haze and Withdrawal of the Federal Implementation Plan, 86 Fed. Reg. 14055, dated Mar. 12, 2021, attached as Ex. 8.

Given the file sizes, we would appreciate confirmation of receipt of this email and attachments.

As noted in our earlier email, please do not hesitate to contact us if you have any questions or need additional information. We would appreciate the opportunity to discuss our findings and recommendations.

Sincerely,

Joshua Smith

March 6, 2020 ["Stamper Report"].

(6) We are also attaching and incorporating 24 separate excel workpapers and files supporting these technical reports.

Given the file sizes, we would appreciate confirmation of receipt of this email and attachments.

Please do not hesitate to contact us if you have any questions or need additional information. We would appreciate the opportunity to discuss our findings and recommendations.

Sincerely,

Joshua Smith

Subject: Protect North Dakota's parks from haze pollution
Date: Wednesday, June 1, 2022 1:50:01 PM

******* CAUTION:** This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *********

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Michelle Gobely

The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Zach Ragbourn

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Gail Frethem

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Robert Jaeger

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Kimberly Nieman

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Rosemarie Jenkins

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Peggy Nelson

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Erv Ziese

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Peter Appleton

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Patti Gmeiner

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Jaci Hupp

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Kaci Caldwell

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Dear Director James L. Semerad,

I and millions of other Americans deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. North Dakota, you have the dubious distinction of having three coal plants in America's top 50 dirtiest facilities polluting our national parks.

These coal plants, other industrial facilities and oil and gas operations across the state are some of the worst sources of haze pollution that ruin scenic views and dark night skies in our national parks and wilderness areas.

All Americans are stakeholders, and I am very disappointed that North Dakota's Department of Environmental Quality has proposed a woefully inadequate Regional Haze plan for the second implementation period that fails to require cost-effective controls for polluting coal plants and the oil and gas facilities. The plan is totally unacceptable and makes no significant progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and rural and indigenous communities near the polluting facilities and the parks.

North Dakota ranks number one among states in its contribution to haze pollution in National Park Service protected areas. You cannot be unaware of the statistics. Your facilities have muddied views, harmed public health, and obstructed clear night skies for far too long.

Please revise the plan by:

1. Implementing strong and emission-reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
2. Requiring emission reductions from the four oil and gas point sources selected, as well as from oil and gas non-point source emissions like engines and flaring.
3. Thoroughly assessing and addressing the environmental justice consequences to local and indigenous communities.

With these revisions North Dakota will put parks, people, and clean air ahead of polluters' interests and make substantial progress toward clearer air in our national parks, wilderness areas, and impacted communities.

North Dakota is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas. If the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. All Americans are stakeholders, and we deserve better than the current plan.

Thank you,

- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Michele Vaillancourt

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Rachel Godbout

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Jessica Wardlaw

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Climate change has been going on for more than 6 decades and I have the articles in The National Wildlife Federation magazine. We were warned that pollution would be our downfall, but money and power won out. We should be concentrating on green energy solutions and jobs, not on more pollution from non-biodegradable dirty coal.

Thank you,
Jo-Ann Sramek

I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Phil Wolfsohn

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Gretchen Bratvold

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Alexander Honigsblum

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Cindy Herrin

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am a former Cessna 172 CoPilot that flew out to enjoy your great state and the visual flight rules were most important to our flight planning. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Andrea Andrea

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has PROPOSED a Regional Haze PLAN for the second implementation period that IS WOEFULLY INADEQUATE and FAILS TO REQUIRE cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- IMPLEMENTING strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- REQUIRING emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- THOROUGHLY ASSESSING AND ADDRESSING the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Brett Hoopingarner

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Joseph Wenzel

Dear Director James L. Semerad,

I deeply value clean air and expansive clear views in general, but especially in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period which is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied views and obstructed clear night skies, as well as harmed our lungs and otherwise impacted our health for far too long.

I strongly urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the health and environmental justice impacts on our communities and planet overall.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas, communities, and our overall planet. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our parks, planet, and the people who travel from across the world to visit them deserve better than the current plan.

Subject: Protect North Dakota's parks from haze pollution
Date: Wednesday, June 1, 2022 9:00:58 AM

******* CAUTION:** This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *********

Dear Director James L. Semerad,

I write today because I deeply value clean air and clear views in national parks and wilderness areas protected under the Regional Haze Rule. I am very disappointed that the Department of Environmental Quality has proposed a Regional Haze plan for the second implementation period is woefully inadequate and fails to require cost-effective controls for polluting coal plants and the oil and gas facilities across the state. The plan is unacceptable and fails to make reasonable progress toward clean air in places like Theodore Roosevelt, Badlands and Voyageurs National Parks, and in our rural and indigenous communities near the polluting facilities and the parks.

Of all the states in our nation, North Dakota has the biggest contribution to haze pollution in National Park Service protected areas, including Theodore Roosevelt National Park, where air quality has degraded steadily since 2016. Our coal plants like Coyote, Antelope Valley and Coal Creek Stations combined with the oil and gas sector emit unacceptable levels of haze-causing air pollution -- more than 72,000 tons combined of sulfur dioxides and nitrogen oxides -- and they must be cleaned up. These facilities have muddied our views, harmed our lungs and obstructed clear night skies for far too long.

I urge you to revise the plan by:

- Implementing strong and significant emission reducing measures for the selected five coal-fired power plants where emissions are long overdue to be cleaned up.
- Requiring emission reductions from the four oil and gas point sources selected, as well as from the oil and gas non-point source emissions like engines and flaring.
- Thoroughly assessing and addressing the environmental justice impacts on our indigenous and local communities.

These revisions will ensure the state is putting parks, people and clean air ahead of polluters' interests and making reasonable progress towards clearer air in our national parks, wilderness areas and communities. The state is obligated to make progress toward improving air quality and limiting haze pollution in Class I areas -- if the plan is left unchanged, it will not comply with the federal Clean Air Act or the EPA's Regional Haze Rule. Our local communities, parks and the people who travel from across the world to visit them deserve better than the current plan.

Thank you,
Jan Myslajek

Subject: Regional Haze Public Comments - ND State Representative Josh Boschee, House Minority Leader
Date: Sunday, May 29, 2022 12:20:04 PM

***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear Director Glatt,

As the ND House Minority Leader, I have worked with both industry and environmental groups to ensure that North Dakotans have a safe and clean place to call home. Our state plan is one that will continue to allow us to work in partnership to remain one of our nation's cleanest air state. Independent data continues to identify wildfires and Canadian industrial emissions as having the biggest impact on our state's air quality.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Joshua Boschee

Dear Director Glatt,

I strongly support the efforts of the Lignite Energy Council. I retired from Basin Electric Power Cooperative in 2013 following a 35-year career there. I'm well aware of the efforts that Basin Electric and the other utilities have made and are making to make sure coal-based electricity remains an integral part of producing electricity for the state and the region.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

While it is good that North Dakota is projected to meet its goals in reducing haze, more could be done. I have seen haze hanging over the oil fields of western North Dakota, like smog in a big city. These oil and gas wells should be included in the regulations by implementing state- or region-wide requirements to limit nitrous oxide emissions as other states have done.

Did you include the Whiting Gas Plant in Belfield in your analysis or the rail facility at Fairfield? Also the proposed Davis Refinery that will be on the doorstep of Theodore Roosevelt National Park (TRNP) South Unit? These facilities are all within 6 miles of TRNP. And Coal Creek needs to be taken into consideration after their sale to Rainbow Energy.

I am not sure why you have included a graph showing Most Impaired Days (MID) along with Theodore Roosevelt National Park visitation. MID occurs regardless of how many people observe it. The Regional Haze Rule is more than just providing clean air for visitors to Class I Areas, residents of these areas stand to benefit both in terms of clearer skies and better health.

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

I am born and raised in North Dakota. My grandparents farmed and ranched, and we still own that land. I'm raising my kids here as both I and my husband work in the coal industry. We are proud of the responsibility of energy producers in this state, and proud of the state meeting all clean air standards. Coal based electricity is an important need for our economy, and over-reaching burdens by the EPA must not be implemented. The ND DEQ's plan is well researched and appropriate for our state.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. Dear Director Glatt,

I have lived in north Dakota for over 40 years and have traveled throughout the state extensively. I have been impressed with how clean the air appears especially given the number of power plants operating within the state. The only visible haze I have seen over the years has always been the result of wildfires out west or in Canada.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Michael Swanson

Dear Director Glatt,

I am writing to you as a mindful supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Thank You for your consideration.

Sincerely,

Dear Director Glatt,

I live in Hazen, ND. My husband works at a coal mine that delivers coal to provide reliable, clean and low-cost electricity. North Dakota is a producer and exports most of its electricity (the majority of it comes from coal) and somehow we have some of the cleanest air in the country. Please, allow us to use our own version of the Haze rule and not subject us to the EPA's government overreach.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. Dear Director Glatt,

ND has some of the cleanest air in the nation. Imposing additional unnecessary regulations that will have no perceptible change in the region makes absolutely zero sense. The lignite industry is crucial to this region and national energy security.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Joe Spiekermeier

Dear Director Glatt,

Whatever is done you need to keep the grid very strong as 30 below and no electricity will be a killer for innocent North Dakotan's. Sky's are very clear in North Dakota. Let the ND DEQ regulate ND. The federal government needs to address immigration since they can't do that they have no business in trying to regulate ND air quaility.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. Dear Director Glatt,

In addition, I was personally on a state appointed committee which had these similar goals thirty years ago and they included things like windmills, and ANYTHING that deterred from the "natural" landscape. Its all become a hoax not supported by science and history, but only by domestic and foreign King Pin Terrorist! All after bringing America and other Western countries to our knees by "creating" starvation and hyper inflation in order to bring us to our knees for their One World Order.

North Dakota is on track, a far better track, to continue to make great strides toward the EPA 2064 goals WITHOUT Federal intervention.

Thank you very much, but leave us alone!

Dear Director Glatt,

The fact that a state has to deal with this federal overreach is ridiculous. This is a state right issue that should not be imposed by the federal government. With all that the state and it's citizens do, there is no need to continue following an unconstitutional agencies (EPA) overreaching standards or control. North Dakotan's continue to set the bar for clean affordable power.

Sincerely,

Dear Director Glatt,

There is absolutely zero need for the NDDEQ or the EPA to impose additional restrictions. The G&Ts and utilities that operate in ND are already committed to clean air and environmental stewardship and have been long before any regulations from liberal Administrations. The Clean Air Act is nothing more than federal government overreach and the NDDEQ should be fighting to keep these within state's decision-making power. The NDDEQ should be supporting clean fossil fuel generation and not peddling the liberal EPA's Green New Deal.

Dear Director Glatt,

I grew up in ND, lived in CA for most of my adult life, and moved back to my great home state several years ago. ND by far has the cleanest air, bluest skies and has maintained beyond superior quality air standards for years. I live in Coal Country and see first-hand the way the coal industry takes pride in preserving and maintaining land, water, and air quality. Lignite energy is our baseload source. It is reliable, CLEAN, and sustainable.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. Dear Director Glatt,

I am writing to you as a supporter of North Dakota's coal powered power plants. They have provided us residents with affordable electricity. I have never heard a North Dakota resident ever complain about the cost of our affordable coal electricity. The coal plants have done a great job of keeping my state's air clean. I have been all over the world and have experienced pollution of the big cities outside of the U.S.A. and I feel so grateful to live in North Dakota and not have to fight for air when I breath. The coal plants have contributed so much to our state's economy as well. Please protect our coal power plants.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Casey Lund

Dear Director Glatt,

As a resident of the State of North Dakota I understand the importance of clean air. There is nothing better than enjoying a summer day on the river with clear blue skies or a night with bright shining stars and clean air to breath, which is normal for North Dakota. Last summer, due to western forest fires, these pleasures were greatly impeded and it was less than pleasant. Smoke filled the North Dakota skies making it both difficult to see the beauty and breath the air.

As an employee of a North Dakota based generation and transmission cooperative I understand the importance of affordable and reliable electricity. As evidenced by the February 2021 weather event, the lack of reliable energy infrastructure imposes significant costs not only on electricity suppliers but on the end use consumer where their supplier was not well positioned with reliable sources of electricity.

As a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. Dear Director Glatt,

North Dakota has the cleanest coal plants in the world. Our state is not the problem. Why don't we fine states hosting giant wild fires because they refuse to manage their forests?

We need and depend on our fossil fueled energy production. We can no longer subsidize impractical solar and wind energy. Please stop penalizing North Dakota's energy production. Go after the real problems like China and India, California fires.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. Dear Director Glatt,

I live only a few miles from a coal fired power plant, there is no haze, we need to keep the coal fired power plants in ND up and running to keep our electricity costs down. 20 years ago the steam rolling from the stacks had a grayish hue to them, for the last decade the money that has been invested in the power plants have made the steam that rolls from the stacks now pure white. If there is visible haze in the parks, it is Not from the power plants in ND. Wildfires and international emissions re to blame, I've been to Canada and have seen the dirty emissions billowing from a plant there. Why do people in China wear masks just to go outside? They are all about making money, not regulating emissions so they have good air quality.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. Dear Director Glatt,

We are a coal mining family, proud of it, proud to live in North Dakota where the air quality is good and we have clean water and a beautiful state for everyone to enjoy. The misinformation about coal is not good. Stop the wild fires as they cause more harm than coal ever will to our air quality. Wakeup and see the facts about the true polluters of the world.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Marcelle Grosz

Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

Dear Director Glatt,

I work at a coal fired power plant. Even in coal country, we pass the American Lung Association clean air tests year after year. That is because of our scrubbers, SCRs, SNCRs, Mercury removal, etc. We are and have always been good stewards of the land and air quality.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. Dear Director Glatt,

I support a visibility plan designed by the North Dakota DEQ. We are one of the cleanest air states in the nation and will continue to be so with our State based policies for our entire energy sector. Personally the ONLY visibility issue we have experienced is the haze from wild fires in Canada! Ever. We passed SB 2238 in Session which is quite clear in its' policy statement.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. ***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Cody Blaisdell
117 12th St NW
Beulah, ND 58523

Dear Director Glatt,

Coal has been and will continue to provide the source for power we can depend on. Especially with the recent MISO studies surrounding the lack of capacity, the removal of Coal-Fired generation could prove to be fatal if there is a capacity shortfall during the extreme cold months of the year in the Midwest.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Ronda Eslinger

Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Dear Director Glatt,

Baseload energy is essential to reliable grid operation at this point in time. The MISO forecast for this summer (2022) is already predicting controlled blackouts with the rise of energy demand and the recent plant shutdowns due to economical hardships (More demand and less supply). As stated in the body of this message below, North Dakota power plants have already spent billions of dollars in emissions controls and they now are among the cleanest in the country. Further implementation of emissions control technology to combat regional haze would be undetectable, unnecessary and ultimately foolish given the current situation that MISO is warning about regarding the energy grid. If we continue down the path of more strict EPA regulations concerning regional haze, the energy grid will only become more unstable as baseload energy generation stations are forced to come offline due to these expensive and inefficient EPA emissions requirements. Thank you for taking a few moments to read over my concerns. I my message is heard and taken into consideration.

Thank you.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Wade Horner

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Dear Director Glatt,

I support the state of ND's Regional Haze State Implementation Plan - Round 2. While it may be necessary for the EPA to work with and guide the state of ND, this must only be accomplished within the statutory bonds of ND and the EPA's authority.

The state of ND must reserve its power to create industry-specific rules and standards based on industry, type of fuel, size, design or emission control equipment best suited for the individual unit.

Environmental laws must be geared toward finding technological solutions that are cost effective and innovative. These regulations must be reasonable and based on science rather than cost in their effort to control or cap emissions. These regulations should not be aimed at reshaping ND industry or determining which industries are allowed to exist.

Just as I am committed to a clean environment, I trust the ND Department of Environmental Quality to successfully manage its own Regional haze SIP and help safeguard the health and environment of North Dakota.

Thank you

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. Dear Director Glatt,

Please read this entire comment. Most of it is cookie cutter response, which I fully believe in. But, there is more info I've thought of.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and our nation. For example, last year's energy crisis in Texas is a good example. Power from our coal based plants had to be shipped there to assist in their crisis. This caused issues with our own regional power supplies, but we worked through it. If Texas still had diversified power sources, they could have avoided their crisis. But laws have made it impossible for them to keep a diversified source of power.. Coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source, and with infrastructure build up the ability to use it nationally, that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020 and 2021, North Dakota experienced long episodes of visibility impairment throughout summer and fall due to these emissions, which the state cannot control. These also caused health and environmental issues in the region too. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

The only time we have visible emission issues in the state, it is due to poor forestry management practices. These practices block logging of any sort and create a tinderbox in the national forests that when they catch fire, it is devastating. during these events we occasionally experience regional haze. regulating power plants would have no effect or benefit to this. stop wasting out tax dollars to implement regulations that only harm industries you don't agree with politically.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Simon Manifold

Dear Director Glatt,

I support the state of North Dakotas plan. They need together but this shall be the decision of the State. Each state should be able to asses and determine what is need to regional haze issues in their state. North Dakota has some of the cleanest and most pure air in the whole entire world. We take pride in our air we breathe, we have to live our lives here. If it was a large concern for our own safety and health we would implement some regulations. We have always went above and beyond the call to reduce emissions in the great state of ND. We don't need someone that doesn't live here to tell us how we should be governed. With this i fully support the States plan on regional haze and it should stay at a STATE level and decision.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

Dear Director Glatt,

North Dakota does not require more controls or regulation in regards to our air and visibility. Further pressures on an already top performing state is nonsensical. We in North Dakota currently appreciate the freedoms of both clean, affordable energy and clean air.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. ***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear Director Glatt,

It is important to me that the Regional Haze State Implementation Plan for North Dakota is considered on its merits. North Dakota has the cleanest air, and I feel strongly that if the EPA chooses to challenge this SIP in a state that operates as well as ND, that will show the political, not scientific bias of the EPA and other states will have little chance of being able to regulate themselves appropriately.

I am also writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for the future of grid stability and reliability. Coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

North Dakota's Coal Industry, as well as the coal industry in many other states have proven to be good neighbors, reliable, low-cost providers of electricity.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

My family depends on my job in the coal industry as do thousands of other hard working men and women right here in North Dakota. Putting more regulations on the power sectors could make things very difficult for these plants to continue to operate. We all rely on energy everyday and these coal powerplants are at the backbone of what keeps the lights on and prices affordable and low for our communities. I also, grew up in the small town Hazen, ND where I lived there for 12 years, and I can tell you that there was no effects of pollution and other risks living so close to several coal power plants. We need to work together and continue to produce electricity as coal for the main fuel source, because it is very abundant here in North Dakota, and the process and overall effectiveness needs to seriously be a major consideration in whatever policies or regulations come in the future. North Dakota has a very bright future, but we need to keep the coal industry thriving for years to come, as so many other states will soon realize the mistakes they are making now. I lived in Washington State for 2 years and most of the electricity came from coal power plants in Montana, unfortunately these plants are being shutdown and it caused prices for residents in WA to get out of control. Lets work together on these issues and talk to everyday people who live in our great state of North Dakota. Thanks Much!

Coleton P. Ford

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Kent Vernon

Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

Dear Director Glatt,

I am a life long ND resident and support the coal industry, its clean air efforts and reliable energy source.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Jody Brorby

Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future. As the Mayor of a small retirement town it's imperative to secure a reliable and affordable energy source.

Sincerely,

Larry Summers

Dear Director Glatt,

Coal is a reliable and efficient fuel source for electrical generation. Coal makes the steel that makes wind generators, which are inherently inefficient and unreliable. Further wind towers are decimating wildlife eg., bald eagles, bats and migratory birds. With the stringent standards set for coal emissions it is the current and future fuel source for the US!

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

Dear Director Glatt,

I believe the air quality in North Dakota has remained very high over the years, and the present emission controls in-place at the coal fired power plants result in the power plants having no negative impact on the air quality across the state.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. Dear Director Glatt,

We support the ND plan and would expect the DEQ to focus on other areas of the US where greater reductions are needed. This is not a one size fits all program.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Dear Director Glatt,

As a North Dakotan who has worked his entire career in the field of Safety and Environmental Health, I value and understand the importance of protecting our environment. Adding more environmental regulations on a state that already outperforms others in the Nation in terms of air quality, while producing more energy and agricultural commodities than most other states simply makes no logical sense. Regulations should be necessary, and add value if they are to be created. Added air quality/regional haze regulations in the State of ND fail both need and value tests.

I am one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

I support the DEQ implementation plan for regional haze.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Brad Steier

Dear Director Glatt,

As a lifelong North Dakotan and a power plant worker for 10+ years, I fully support North Dakota Department of Environmental Quality (DEQ) and their visibility plan. North Dakota DEQ has set our State up for long-term success and I am proud to say I live in a State where clean and clear air, environmental concern, and energy industry can co-exist to ensure our electric grid is supplied with reliable, affordable electricity.

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Dear Director Glatt,

I am proud to live and work in a state that has allowed the energy industry to be a good steward of the resources we are blessed to have. Coal, in particular, has provided an economic source of electricity for decades, while supporting thousands of jobs directly, tens of thousands indirectly, and everyone else in some form or fashion. There is a reason developed and thriving nations are that way...it is due to the constant, reliable and economic availability of electricity. Because of the former, we enjoy clean water, clean air, enough energy to produce whatever we can dream up and the resources we need to thrive. Countries and regions that don't have constant, base-load energy available on demand are stuck in the third world as they have no means to advance their society out of poverty. The USA, and the world, are demanding more reliable power, more energy, not less. Coal has, currently does and will into the future, provide humans the constant, reliable and economic energy we need to electrify everything. You want more electric cars, lawnmowers, bikes, phones, tvs, smart homes, etc...you need constant, always on, always ready, dispatchable power. Coal has proved it can and it will. We cannot continue to throw good money after bad to prop up intermittent power, such as wind and solar, while also regulating out of existence, coal. North Dakota has both some of the cleanest air and water in the country, while, at the same time, some of most coal-based generation, per capita, in the country. It is absurd to continue removing coal, while also demanding exorbitant costs to the coal industry that remains. Coal, if left alone, versus solar and wind, not propped up by tax credits and preferential treatment, wins...every time! Can you plug in and charge millions of electric cars when you get home at night using a grid built with solar and wind? No, it always dark and usually much less windy at night. Can you do the same with a grid built on coal? Yes, it is always there and ready for you. Please stop messing with a good thing. Make coal legal again!!

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

Dear Director Glatt,

Having worked for 28 years as an engineer in ND's largest power plant, Coal Creek Station, I spearheaded projects that included world class leakage limitation from their waste disposal sites. I also spearheaded beneficial use of the fly ash as a replacement for Portland Cement (the calcining of which produces about one ton of CO2 for every ton of cement).

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. Dear Director Glatt,

Please use common sense and pay attention to the actual reasons for any visibility issues with air quality in North Dakota. Fortunately, we have wonderful air quality and affordable electricity in this state. As provided, any air quality issues here are from sources beyond our control.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Curtis Breimeier

Dear Director Glatt,

The state government of North Dakota has done more than its share to align with federal environmental concerns, which shift with national politics--every year.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064--the goal set by the United States EPA.

Dear Director Glatt,

My husband is a VFR private pilot and we have flown in and around North Dakota for decades. We also farm in ND. So we do pay a lot of attention to the weather and to the skies and to visibility. One thing that I can state with absolute certainty is that when our skies are hazy is when there are fires in Canada. Over the years, there have been instances when the visibility has been too poor for us to fly and that has ALWAYS been when there is smoke in the atmosphere from fires in Canada. Our air quality is directly impacted by fires that are not from here. I would also like to point out that my husband and I have talked about how we have noticed the power plants have cleaned up their emissions as our skies no longer have that orange streak that was visible back in the 70's and 80's. I also would like to add that during the spring and summer I hang my clothes outside to dry on the clothes line. My clothes smell so nice and clean! Logic would tell you that with 5 coal plants in this area that our air would not be very good, but as a resident here; I can say that is not the case. Our plants have done a very good job of cleaning up their emissions and they should be applauded and encouraged to continue along that path by your support and to support them to share their knowledge with other coal plants.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Jeremy Eckroth

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. ***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear Director Glatt,

I support what the ND DEQ already has in place for visibility regulations. As a supporter of our diverse energy resources in our region, coal-based electricity must continue to be the majority part of production. It strengthens the communities that surround it, supplies a super base load and qualifies as being the cleanest in the country. ND Coal = reliable power.

More importantly, North Dakota's coal industry is a good for the people around it.

The industry has significantly invested in its power plants over the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment by 2064. As usual, ND is ahead of the game when it comes to energy!

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. We also experienced more allergic reactions to the smoke coming from out of state.

New regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

Power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility.

I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean air and a clear sky, along with a reliable, affordable electricity supply, today and in the future.

Sincerely,

Dear Director Glatt,

I wish that people would realize that Green isn't the answer. In order to run all of these electric cars, it will take coal fired electricity. Our power plants are cleaner now than ever because of measures taken by these plants. The few days out of a year that we have limited visibility is due to smoke coming into the state from other areas. We need these coal fired power plants and it's time the people in Washington DC realize it.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Janel Johannes

Dear Director Glatt,

I've been in the coal industry for 6 years, but I've grown up with it my entire life. We need to focus on education so that others can see all the good we've already accomplished. The federal gov't should be using North Dakota as a poster child for how well we've implemented technology and maintained our clear skies.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Cory Gullickson

Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

I am a 3rd generation coal power plant worker, and grew up in coal country of ND. I have seen first hand that coal power plants can and do operate cleanly. Here in ND we have the cleanest air in the nation, while also leading the nation in coal power production.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

I am confused as to why any of the state regulators care about this when they openly allowed for drilling in our state parks & near them. The light pollution & garbage on the side of the road around our state parks from oil field traffic is more of an issue than "haze".

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

Dear Director Glatt,

As a consulting engineer working in the power and mining industries I understand the strides we've made toward the goal of eliminating regional haze better than most. I know how important energy is in our communities and in our society in general and understand the incredible magnitude of investment and effort that has been devoted toward meeting the regional haze requirements. I feel the NDDEQ is far better prepared to address this important issue and wholeheartedly advocate for this approach.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. ***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear Director Glatt,

I am writing to you as a supporter North Dakota's coal power plants and the abundant, balanced, reliable, low-cost energy they provide. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. The current trend of energy resources transitioning away from traditional sources for new technologies that do not provide the security or reliability is irresponsible policy.

As an avid outdoorsman I spend a significant amount of time recreating in Western North Dakota and believe North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA. Anyone who spends any time in the North or South unit of the Theodore Roosevelt National Park knows how clean and clear the air is and that visibility and air quality are not an issue.

Wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, this pressure is misguided. Additional regulations on coal fired power plants in the region would have no effect on visibility in these areas. Further additional stress on this energy production threatens the livelihoods of those in our state. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality

(DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Matthew Marshall

Dear Director Glatt,

I am writing to you as a supporter of State of North Dakota primacy for all permitting, and in this case air permitting. The citizens of North Dakota feel more strongly about having clean air and water in our state than a bunch of self declared experts from Washington D.C. And our local regulators are more capable, more knowledgeable, and better qualified in every regard to make the best decisions than are federal employees who have never even been to this state.

North Dakota does not have a problem with air quality. It is exceedingly presumptuous, and completely incorrect, to assume that we need federal interference with protecting our natural resources.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

I live in Stanton. I have spent my entire life in North Dakota's coal country. I can see with my own eyes, without question, that every power plant in the region is operated in an environmentally sound manner. Employees take personal responsibility to ensure the plants and their associated environmental control equipment are running appropriately. Why? Because we live here! We want our own homes to be clean and healthy.

I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. Dear Director Glatt,

On behalf of the Company I work for, Marvin, we have facilities in both MN and ND. At one of our facilities in MN, we have had ambient air monitors running for a few years. We clearly understand the real impact to the results are from wildfires, and understand that will impact ND monitors as well. We also understand the amount of air permitting work involved with our facilities and emission control equipment at our facilities, including those in ND. We fully support the "NDDEQ Visibility Plan", their efforts and resulting clean air in ND. Industry investment has been significant, and reliable energy is something we all need, at work, home and elsewhere. Thank You for all the efforts and the opportunity to comment. NDDEQ's approach is supported.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. Dear Director Glatt,

As a long-time North Dakota resident, it is clear to me that state leadership has an excellent grasp on the best ways to handle the critical issues impacting the state, including the issue of air quality. The driving issue with ND air quality is not coal power plants but rather wildfires from Canada.

As a supporter of highly reliable, low-cost energy, I value a diverse set of energy resources for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. Dear Director Glatt,

As one of the over 14,000 North Dakotans that works in or supports the lignite industry, I am writing to you in support of the North Dakota Department of Environmental Quality (DEQ) State Implementation Plan for Regional Haze. Coal has been and will continue to provide the source of power we can depend on, and it should not be overly burdened with costly and ineffective regulations.

DEQ's visibility plan appropriately recognizes that our industry has significantly invested over \$2 billion in the last decade to ensure the state continues to have the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall as a result of these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern- instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Kelli Johnson

Dear Director Glatt,

I support each states right to implement and control their own plans

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Dear Director Glatt,

If Canada has reduced their emissions by 20% why should we have to go lower. The causes come from wildfires outside our states and country. I have lived in ND my whole life and the air is clean. You can only scrub something so many times to get it cleaner before a smart person looks upstream or downstream to find the cause, instead of hurting American energy . Look elsewhere.

Dear Director Glatt,

ND skies are clear, we do not need additional controls on air pollution in ND. If you want to do some good, start with forest fires, don't allow them. Next have our neighbor to the north, Canada clean up their coal burning power plants. Then have are neighbors to the south add pollution controls to their volcano. Then cut off coal to China since their air is very dirty also. The reao point here is the problem isn't here in the US. Until these other countries start doing their part we don't need to further burden the US economy. We need reliable, affordable energy. Note that reliable part. Wind mills are part of the solution, but they are not the solution. Do what is right for ND. We already have very clean air

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Dear Director Glatt,

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Coal has been and will continue to provide the source for power we can depend on.

More importantly, North Dakota's coal industry is a good neighbor. In accordance with DEQ's visibility plan, the industry has significantly invested in its power plants over the last decade to ensure the state continues boasting the cleanest air in the country. These investments reduced emissions by 66% and put the state well ahead of the path to eliminating visibility impairment in its parks by 2064-the goal set by the United States EPA.

State researchers report that wildfires and international emissions are the primary causes of visibility impairment. In 2020, North Dakota experienced long episodes of visibility impairment throughout summer and fall due these emissions, which the state cannot control. Due to the continued drought in far western regions, state experts believe this trend could continue. Costly new regulations imposed on power plants will not address this concern-instead, resources should be dedicated to reducing the fires that are the source of the haze.

I understand DEQ may be under pressure to impose new controls on power plants, even though power plants are not the primary cause of visibility impairment and new controls would not meaningfully improve visibility. Therefore, I urge support for the implementation plan developed by the North Dakota Department of Environmental Quality (DEQ) that ensures our region continues to benefit from clean and clear air along with reliable, affordable electricity supply, today and in the future.

Sincerely,

Tim Yantzer

Dear Director Glatt,

I'm COO of a contract manufacturer in Eastern ND. We are an ESOP and have a team of 320 employee / owners. It's critical to our business to have reliable, affordable power. Lignite fills part of that need. North Dakota has good common sense approaches to all of the environmental concerns regarding industry.

I am writing to you as a supporter of abundant, balanced, reliable, low-cost energy. A diverse set of energy resources is crucial for our region, and coal-based electricity must continue to be part of the equation. I support retaining coal as a regional energy source that will help keep electric rates low, jobs plentiful, and our economy robust. Dear Director Glatt,

I am proud to be from North Dakota and part of the manufacturing community that operates in the region. The North Dakota way of life with open spaces and clean air is something that we cherish and appreciate the efforts that have gone into assuring that it will be here for generations to come. As a manufacturer, we are reliant on the affordable energy that is produced in North Dakota. We compete with companies around the world and reliable, low cost energy is something that helps us maintain our manufacturing in North Dakota compared to other regions of the country or other places around the globe. I support the implementation plan developed by the North Dakota Department of Environmental Quality to maintain our clean air and clear skies, and retaining coal as a regional energy source that will help keep electric rates low and jobs in the State.

Sincerely,

I support the state of ND's Regional Haze State Implementation Plan - Round 2. While it may be necessary for the EPA to work with and guide the state of ND, this must only be accomplished within the statutory bonds of ND and the EPA's authority.

The state of ND must reserve its power to create industry-specific rules and standards based on industry, type of fuel, size, design or emission control equipment best suited for the individual unit.

Environmental laws must be geared toward finding technological solutions that are cost effective and innovative. These regulations must be reasonable and based on science rather than cost in their effort to control or cap emissions. These regulations should not be aimed at reshaping ND industry or determining which industries are allowed to exist.

Just as I am committed to a clean environment, I trust the ND Department of Environmental Quality to successfully manage its own Regional haze SIP and help safeguard the health and environment of North Dakota.

Thank you

Chris Renner

Subject: Revise the Regional Haze Plan and require cost-effective pollution controls to protect our national parks
Date: Sunday, May 29, 2022 12:47:08 PM

***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

Martha Herrero

***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

Saran K.

***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

B. Robinson

Dear ND DEQ,

We love visiting our National Parks! One of the benefits that people should expect when visiting them is to have clean and fresh air to breathe. Many people who live in areas where manufacturing and other issues cause pollution want to be able to go somewhere that they don't have to deal with that. Our national parks are such a place that they should expect it!

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

***** CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe. *****

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

Richard Anderson

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

Sue Lynch

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

George Snipes

Dear ND DEQ,

It's remarkable that we now wake up to hazy ozone days where the particulate matter can fill our lungs- even with microplastics! The time for action is now to reduce and stop all toxic waste from entering our air and water. Just because we can't see it doesn't mean that it isn't doing extreme harm. Haven't seen what invisible viruses can do too? Please be innovative and think of a way to be a climate helper (there's valuable marketing in that!) rather than an environmental destructor.

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

Dear ND DEQ,

This is the old, "Pay me now or pay me later," situation. There will be consequences for everything we do that does not reduce the hostile weather patterns of recent years. The only question is whether we choose to suffer those consequences and, hopefully, learn or do we learn now and avoid those consequences.

Personally, I am tired of suffering from the poor decisions made by those who feel they could control reality out of existence. The reality in this case is whether the weather is changing because of man or naturally. The facts are that, no matter what the cause, we need to rid ourselves of the problem before we are left with a situation that we can't live with.

We didn't create the environment that we live in and we would be wise to not disagree with the individual who did.

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

Dear ND DEQ,

I moved to ND from Los Angeles many years ago right out of high school and the main reason was to escape the horrible air pollution in LA. Air quality is very important to me as you might guess. Once you have lost it, you never get it back. ND needs to take it seriously to regulate our energy companies and make sure that they comply with clean air standards to protect us from poor air quality. Industry does not have the right to set standards for the people of ND.

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

Dear ND DEQ,

What good is having wealth if achieving that goal means that you must sacrifice everything that would allow you to enjoy it and proving to everyone with intelligence that you believe that monetary wealth is more important than having the respect and appreciation of the people who surround you, including the designer and Creator of the place you are wrecking.

People can be happy without wealth. I seriously doubt they can be happy knowing that they would sell the health and welfare of everyone on earth, including those they claim to love, for a buck. If they can, who would admire them?

Dear ND DEQ,

Previous generations set aside certain special areas of land; national parks, wildlife areas, and wilderness areas, to be protected in their natural state for future generations to enjoy. Our generation now has both the privilege and obligation to ensure the continued vitality of these lands. I urge you to protect Theodore Roosevelt National Park, Lostwood National Wildlife Refuge, and other important North Dakota wild lands by amending the proposed North Dakota Regional Haze Plan to include the revisions listed in the message below. Thank you in advance.

Wayde Schafer

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

Dear ND DEQ,

Despite the great strides that have been made implementing the Clean Air Act's regional Haze Rule in some states, North Dakota has proposed a regional haze plan that fails to reduce pollution, falling short on the state's statutory and regulatory obligation to improve air quality for our parks and communities.

To satisfy the text and purpose of the Regional Haze Rule and the Clean Air Act, we ask that the state revise its plan by:

- Requiring cost-effective, technically-feasible emission controls identified in the review of emission-reducing measures (four-factor analyses) for the coal power plants and oil and gas facilities the state selected for review in this planning period.
- Establishing a cost-effectiveness threshold for reasonable progress and one that is in line with other states.
- Correcting the inflated cost of controls calculations.
- Thoroughly assessing environmental justice impacts (as EPA recommended).

Not only does poor air quality affect the health and enjoyment of those visiting our national parks, it also threatens our economies. Our national parks provide nearly \$42 billion in economic benefit and support hundreds of thousands of jobs across the country each year. Without strong safeguards protecting the air we breathe, we can't keep these places and local economies strong, let alone keep people healthy.

Please revise the regional haze plan to protect our health, our lands, and our economy!

Sincerely,

Paul McDermott

Hi all,

This is an informal coordination call between Montana and North Dakota to discuss regional haze topics that are of interest to both states. Specifically, we will talk about SIP work to-date as well as possible coordination on upstream O&G and international impacts.

I don't foresee us needing web access for the call, just the phone number and access code below.

Subject: RE: Upcoming Regional Haze Webinar - Request

Rebecca,

North Dakota is interested in having a kick-off discussion with Montana per your email below. You are right, upstream O&G and international impacts are both very pertinent to ND and MT. A coordinated approach to address O&G from our states and others (CO/WY) would be ideal.

As a follow-up to our discussion, the morning June 12th works for us to have a kick-off meeting to discuss these topics plus anything else pertinent to RH.

If you would confirm with the MT RH staff this morning will work and respond with a proposed time – we will speak Wednesday, June 12th. Let me know if you want to discuss anything in advance of that date.

Thanks for the info, David.

As a follow-up, I have had “schedule call with North Dakota” on my to-do list for a while now. Would you all be interested in chatting with the Montana regional haze team at some point in the near future? We have had informal calls with both Idaho and Wyoming to check-in on progress and near-border Class I areas.

Specifically related to your email below, we’re interested in trying to coordinate with neighboring states on an approach for upstream oil and gas. We heard pretty strong feedback from the USFWS on our progress report that they expect something this round. From our conversations with Wyoming, I believe they’re also interested in some sort of coordinated approach. In addition – I know ND shares our concerns with international impacts from sources in Canada located very near the border and I would be interested in starting a conversation on that topic as well, although we don’t have a solid path forward developed yet (apart from waiting to see EPA’s modeling results).

If you're interested in getting a call on the calendar, let me know what works for you. If you're busy with Round 1 conversations right now and prefer to hold off, that works too.

Thanks again,
Rebecca

Hello Rebecca,

Below is an email response on where North Dakota is at regarding the topics listed in your email (copied, as follows, with response in red text):

- Are you using Q/d as a screening tool? If so, what threshold are you using to determine which sources require further analysis? Did you include PM10 in your calculation of Q?
 - Yes, North Dakota used a Q/d of ~10 as the threshold for reaching out to sources. 10 sources were selected, 6 coal EGUs and 4 other facilities. The initial 4F request letters were sent in May 2018. (attached "Basin RH2 Letter.pdf" as example)
 - I checked North Dakota's selections vs the WRAP Q/d tool and it was in direct alignment with the sources selected.
 - PM10 was not included. ~80% of North Dakota's impairment is from sulfates and nitrates – so we had the sources focus on NOx and/or SOx (depending on the units which emit at their facilities).
- How many sources are "screened in" based on your selected threshold?
 - 10. No current plans to reach out to more.
- Are you focusing on any particular industrial sectors in this round of planning?
 - Not targeting anyone specifically, targeting those which are believed to impact Class I visibility.
 - North Dakota is hopeful to follow EPA/other states on addressing RH from the O&G upstream sector (wellsites).

Sources selected:

- 6 Coal EGUs (similar to Round 1).
- 1 coal gasification facility
- 1 NG compression facility (located near TRNP north unit "Class I" area)

- 2 gas processing plants
- Have you contacted the screened sources to discuss the four-factor analysis?
 - Yes, started communications with letter in May 2018. Many phone conversations since then.
- How did you (or will you) determine which emitting units at a source require the full four-factor analysis?
 - Start with the emissions profile for the facility,
 - narrow down to the units of concern,
 - determine current “level of control” and whether or not additional controls need to be evaluated.
- Have you consulted informally with EPA, FLMS, or neighboring states/locals/tribes on your screening or analysis?
 - Not for Round 2. North Dakota is working with EPA (and just engaged FLMS) on a Round 1 revised SIP for a ND Coal EGU we are hoping to resolve in advance of Round 2 deadlines.

Feel free to share this information during the June 20th webinar.

Let me know if you have any questions/comments or want to discuss these in greater detail, thanks.

Subject: Upcoming Regional Haze Webinar - Request

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

Hi State/Local Leads –

The Coordination & Glide Path Subcommittee and the Regional Haze Planning Work Group co-chairs are working to plan our next milestone webinar. We plan to hold the webinar on Thursday, June 20 at 12:00-2:00pm Mountain Time (save-the-date email coming soon). Topics will include updates on fire emissions from the Fire & Smoke Work Group, an update from the Oil & Gas Work Group on their operator survey effort, and a discussion of point source emissions projection methodology for future year emission scenarios.

Following the last webinar in March, we’ve heard that folks found the brief status updates from states (we heard from CO, WA, AZ, and MT) very helpful and so I’m seeking volunteers for a similar “open mic”-type agenda item for this upcoming webinar.

Would you or someone else from your state be willing to give a five-minute update on your efforts to-date to establish a Q/d threshold, how many sources you're working with, whether there are any particular industries you are focused on in this round, and generally how things are going? I know many states shared updates on the Control Measures Subcommittee call last week and I think that would be great info to share with the webinar participants as well. If you're willing to share an update on the webinar, would you please respond by Friday 5/31 to let me know?

Specifically, some topics of interest include:

- Are you using Q/d as a screening tool? If so, what threshold are you using to determine which sources require further analysis? Did you include PM10 in your calculation of Q?
- How many sources are "screened in" based on your selected threshold?
- Are you focusing on any particular industrial sectors in this round of planning?
- Have you contacted the screened sources to discuss the four-factor analysis?
- How did you (or will you) determine which emitting units at a source require the full four-factor analysis?
- Have you consulted informally with EPA, FLMS, or neighboring states/locals/tribes on your screening or analysis?

Thanks in advance!
Rebecca

Don,

The Department has made this information available through our website at the following location:

<https://deq.nd.gov/AQ/planning/RegHaze.aspx>

At the bottom of the webpage under North Dakota's Progress, you can access the Regional Haze Files. Specifically, you will find:

Round 1

- communications regarding updated Great River Energy Coal Creek Station BART analysis (outstanding from the 1st round – 1st bullet)
- 5 year progress report post round 1 (2nd bullet)
- Other final documents from the 1st round of regional haze program (bullets 3 through 6)

Round 2

- four-factor requests, four-factor reports received, NDDEQ responses on four-factors (to date), and revised four-factor reports received
 - this was requested in your email

Let me know if you have any questions as you review the information.

David

David, thanks for sharing this information. Would it also be feasible for you to share the industry response to your May 2018 request?

On Mon, Jul 15, 2019 at 9:22 AM Stroh, David E. <deStroh@nd.gov> wrote:

Hi Don,

Thank you for the email regarding source selection for four-factor analysis. The criteria/approach you used is consistent with what North Dakota did in May 2018. This is also consistent with the guidance and tool produced by WRAP for states to use for selection of sources potentially impacting visibility in Class I Areas. Here is a link to WRAP website containing tool and info on Q/d analysis: <http://views.cira.colostate.edu/tssv2/Emissions/QDAnalysis.aspx>

As you indicate in the email, the guidance recommends states address 80% of the visibility impairment in Class I areas. Through the four-factor analysis, North Dakota is addressing approximately 80% of the visibility impairment (nitrates and sulfates) as determined by the IMPROVE monitoring network in North Dakota (<http://vista.cira.colostate.edu/Improve/agrv-summaries/>). North Dakota sent four-factor request letters to the ten highest Q/d facilities in North Dakota, which addresses ~94% of the 2012-2016 emissions from stationary sources. Q/d for the sources selected in North Dakota ranged from 7 to 164. See attached "4 Factors Source Analysis Q over D" for a list of the sources North Dakota has selected for four-factor analysis. The list is consistent with the recommendations provided in your email attachment (North Dakota also included Northern Border Compression Station No. 4 for analysis).

Additionally for your information, I have attached the four-factor request letters sent by North Dakota in May 2018. North Dakota has received responses from all the facilities and is in the process of reviewing the analysis for completeness and accuracy. Please let me know if you have any additional questions, comments, or would like to discuss.

Subject: ND facilities for potential RP analyses

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

Hello David,

I am sending the attached list of ND facilities for potential 4-factor RP analyses. Please accept this information as part of our discussion on how to address this task.

EPA's draft RP guidance recommends that states capture enough facilities for 4-factor RP analysis to account for 80% of the impact at each Class I area. I have used Q/d as a surrogate for impact (as allowed by EPA guidance). My calculation of "Q" includes only SO₂ + NO_x because I have discovered that PM is typically already very well controlled or, in the case of surface mines (e.g., copper, coal), their very large emissions can have a great impact on facility selection with essentially no way to further reduce PM emissions. (EPA's draft guidance advises not reviewing facilities that have little potential for additional control.) Also, Clean Air Markets Data (CAMD--now AMP) does not include PM. For "d," we calculated the distance to all facilities in the 2014 National Emissions Inventory (NEI) out to about 1000 km.

Our basic approach follows:

1. Extract from the 2014 NEI all facilities within about 1000 km of the NPS Class I area most-impacted by ND facilities.
 - o Theodore Roosevelt NP (THRO)
2. Calculate Q/d.
3. Delete airports and rail yards because states have little regulatory authority.
4. Substitute more recent data for EGUs available from CAMD/AMP. Use projected/expected changes in EGU emissions for this planning period.
5. Rank the remaining facilities by Q/d and select those facilities contributing to 80% of impact (total Q/d) at each NPS Class I area.
6. Combine the sets of selected facilities for each NPS Class I area to produce combined lists based upon the highest impact at the NPS Class I areas.

Please feel free to comment or ask questions.

thanks,

Subject: FW: North Dakota's Regional Haze progress and information
Attachments: Regional haze Q over D Analysis

Don and David,

I wanted to keep you informed of North Dakota's regional haze progress regarding Round 2 planning and Round 1 resolution efforts. See the email sent to EPA region 8 planning group yesterday (below) for more information and links to the information we have made available on our website.

Additionally, I extended an offer (**highlighted** in the email below) to EPA R8 for Great River Energy (GRE) – Coal Creek Station to present an overview of the recently submitted revised NOx BART analysis. EPA R8 is interested in this and we are in the process of coordinating a time for this to happen. Tentatively leaning toward an afternoon later next week (9/25-9/27).

I realize this is short notice, but if it something you would be in interested in attending - please let me know and I can keep you appraised of the date/time. If it wouldn't happen to work for you next week, we could look at doing something independent in the upcoming weeks.

Let me know if you have any questions or comments.

Regards,
David

Subject: North Dakota's Regional Haze progress and information

Aaron,

As a follow-up to our call this morning. Here is the link to North Dakota's regional haze files for Round 1 resolution and Round 2 planning: <https://deq.nd.gov/AQ/planning/RegHaze.aspx>

Toward the bottom of the page, you'll find a "North Dakota's Progress" section. Within that section, "Regional Haze Round 1 Files" and "Regional Haze Round 2 Files" are contained. The first bullet under the "Round 1 Files" contains the GRE-CCS revised NOx BART analysis (received late last week) and correspondence associated with the development of that package. Under the "Round 2 Files", we have uploaded the: four-factor request letters, the four factor reports received to date, and formal communications between the facility and DEQ regarding our comments on the initial analysis received.

One other item I was going to mention/ask in our call. Prior to NDDEQ receiving the revised GRE NOx BART Analysis, GRE presented a PowerPoint overview of information contained in the report. I found this overview helpful as I have begun to thoroughly review the report. GRE offered to repeat this presentation/overview to you (and/or other EPA R8 staff). If this is something you think would be helpful, let me know and we can coordinate a time for this to happen.

Lastly, I have attached a NDDEQ internal Q/d email from May 2018 which outlines our original rationale for the sources selected for four factor analysis. The attachment also includes spreadsheets summarizing the Q/d information. *Side note to Q/d info* – here is a link to the NPS files sent to WESTAR-WRAP states regarding state sources for consideration of four factor analysis: https://www.wrapair2.org/RHP_Control.aspx. As you can see the NPS suggestions are in line with the sources already selected by NDDEQ.

I'd be happy to discuss any of this information after you get a chance to review.

Regards,
David Stroh

Subject: Regional haze Q over D Analysis
Attachments: 4 Factrors Source Analyssis Q over D.xlsx; Voyageurs Q ove D Analysis.xlsx

Hi all:

Attached is a spreadsheet that contains a Q/D (tons/km) analysis for Regional Haze Round 2. The analysis was done the same way we did it in Round 1(i.e. total SO₂ plus NO_x emissions for Title 5 sources divided by the distance to the nearest Class I area). As suspected, coal-fired EGUs dominate the Q/D analysis. Based on the average of 2012-2016 emissions, the coal-fired EGUs account for 86% of the emissions and 78% of the Q/D (EPA guidance suggests we address at least 80% of the impact from in-state sources). The Stanton Station is included in this analysis; but, as we all know, it is now shutdown. Please note the emissions do not include other minor point sources we track and area sources. Using the 2014 NEI, the coal-fired EGUs would only account for 39% of the total SO₂ and NO_x emissions. Of these other SO₂ and NO_x emissions in the 2014 NEI, only a small portion are controllable by us.

In the 2012-2016 emissions Q/D analysis, there is a very distinctive break point after the Northern Border No.4 station (Q/D of 8.7 versus 4.5 for the Grasslands Gas Plant). If you include DGC, the Tioga Gas Plant, the Little Knife Gas Plant, and Northern Border No.4 in the four factors analysis, you get 94% of the emissions and 93% of the Q/D. If you go down through the top ten sources in the Q/D analysis, you get 95% of the emissions and 96% of the Q/D. Some of the sources in the top ten, such as Hawkeye Compressor Station and Little Missouri Gas Plant, are very well controlled (recent PTCs); so, there is not much to gain from these sources. It is my understanding that the Fort Buford Compressor Station is now shut down. That leaves the Grasslands Gas Plant, Mandan Refinery and the Lignite Gas Plant. Perhaps these sources should be reviewed more closely to see if we can get some reductions from a four factors analysis.

The 2017 emissions are not quite complete yet; however, I was able to get emissions for the coal-fired EGUs and the top ten sources from the 2012-2016 Q/D analysis. The break point after Northern Border No.4 is still there. Once all of the 2017 emissions are available, I will complete the analysis for 2013-2017. I believe the 20117 emissions will not change our decision for which sources we want a four factors analysis.

I also conducted a Q/D analysis solely based on Voyageurs National Park for the coal-fired EGU's (see attached spreadsheet). Interesting that ACS has bigger Q/D than some power plants at Voyageurs. Perhaps this will be an issue with Minnesota.

We probably should have a meeting to decide what additional sources we want a four factors analysis. One other point to consider is the EPA guidance that indicates we must address more than 80% of the impact sources if we do not meet the glide path (we did not meet the glide path in Round 1).

If you have any questions, please see me.

David (and Tom),

Thanks for the update/heads-up. Yes, i would be interested sitting in on a presentation by GRE regarding CCS, and i would appreciate it if you would let me know when that might happen.

Regarding selection of facilities for four-factor analyses for the next phase of Regional Haze/Reasonable Progress work, i was very pleased to see how closely our lists matched. I have recently begun thinking about how we can address the impact of new source growth on Class I areas like Theodore Roosevelt National Park. For example, i saw that NDDEQ recently concluded a public review process for expansion of Targa Midstream's Little Missouri River Gas Plant a few kilometers from the Park. It is my understanding that this permit application did not trigger PSD or any BACT requirements. However, the resulting Q/d, if this facility is constructed as proposed, would easily exceed the thresholds NDDEQ used to trigger a four-factor RP analysis. Furthermore, we are aware of a similar project in VA with lower NOx emissions. The information contained in the attachments indicates that Dominion Energy's Buckingham County (VA) Compressor Station includes a Solar Centaur 50 compressor turbine (similar to the three CTs proposed by Targa) that is equipped with SoLoNOx and SCR to meet a NOx limit = 3.75 ppm (compared to 15 ppm at LMGP). Likewise, our comments on Meridian's Davis Refinery noted examples of similar emission units with lower permit limits. It is likely that there are several more similar situations where new source growth may need to be accounted for as we formulate strategies to make reasonable progress during this planning period. I would appreciate any additional thoughts you and Tom might have on this.

I found this overview helpful as I have begun to thoroughly review the report. GRE offered to repeat this presentation/overview to you (and/or other EPA R8 staff). If this is something you think would be helpful, let me know and we can coordinate a time for this to happen.

Lastly, I have attached a NDDEQ internal Q/d email from May 2018 which outlines our original rational for the sources selected for four factor analysis. The attachment also includes spreadsheets summarizing the Q/d information.

Side note to Q/d info – here is a link to the NPS files sent to WESTAR-WRAP states regarding state sources for consideration of four factor analysis: https://www.wrapair2.org/RHP_Control.aspx. As you can see the NPS suggestions are in line with the sources already selected by NDDEQ.

I'd be happy to discuss any of this information after you get a chance to review.

Regards,

David Stroh

Hi, Rick and David – I didn't know if you guys have met, so I wanted to suggest a brief call to coordinate on SD's 4factor work with the "consistent WESTAR-WRAP states' effort" that David is leading.

Rick – we have some materials that David (or I could help) can walk through, and we'd like to learn more about the 2 sources you all are looking at.

Would you guys have some time on Monday the 23rd, say 900 AM MDT / 1000 AM CDT? I can send us an appt.

Thanks.

To: Bouchareb, Hassan (MPCA)
Subject: RE: North Dakota 4-Factor Analysis

Hi Hassan,

Here is the link to North Dakota's regional haze files for Round 1 resolution and Round 2 planning: <https://deq.nd.gov/AQ/planning/RegHaze.aspx>

Toward the bottom of the page, you'll find a "North Dakota's Progress" section. Within that section, "Regional Haze Round 1 Files" and "Regional Haze Round 2 Files" are contained.

The first bullet under the "Round 1 Files" contains the GRE-CCS revised NOx BART analysis (received in Sept. 2019) and correspondence associated with the development of that package.

Under the "Round 2 Files" – specific to what you requested, we have uploaded the: four-factor request letters, the four factor reports received to date, and formal communications between the facility and DEQ regarding our comments on the initial analysis received.

The NDDEQ is in the process of reviewing these reports and determining what is considered reasonable for round 2.

Let me know if you have any questions or comments, thanks!
David

Good morning David,

If you remember, we both spoke at the Class of '85 State Meeting on Regional Haze. In your presentation, I think you had mentioned that you had already received some 4-factor analyses from some coal-fired EGUs? Are those analyses posted or available

somewhere? I'm looking for what's available to try and gauge what levels of control utilities are looking at and what seems reasonable. If you can share those analyses I would appreciate it.

Feel free to contact me if you have any questions or if there is anything I can help you with as well.

Thank you!

Subject: MT/ND State-to-State coordination call
Location: Skype Meeting

Start: Tue 6/2/2020 2:00 PM
End: Tue 6/2/2020 3:00 PM

Recurrence: (none)

Meeting Status: Accepted

Organizer: Payne, Rhonda

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

MATERIALS ADDED:

- 1) Agenda and background regulatory information
- 2) WEP-AOI Slides for discussion

Talk to you tomorrow!

Hi David,

MT would like to take this time to begin conversations with ND on a coordinated emissions management strategy to address potential interstate emissions impacts in our respective CIAs.

I am working on a packet of information for our discussion that I'll attach to this meeting request by the end of the week.

Our rough agenda is:

- Montana's schedule for submitting a draft SIP for FLM review by July 10.
- Consider guidance listed in Step 2: Determination of affected Class I areas in other states
- Current URPs for Medicine Lake, Lostwood, Teddy Roosevelt
- Current WEP/AOI results for Medicine Lake, Lostwood, Teddy Roosevelt

If there is anything else you'd like to add, please let me know!

Talk to you on Tuesday, June 2nd at 1:00pm MST.

Thanks,

Rhonda

Agenda:

- Montana's schedule for submitting a draft SIP for FLM review by July 10.
- Consider guidance listed in Step 2: Determination of affected Class I areas in other states (see excerpt below)
- Current URPs for Medicine Lake, Lostwood, Teddy Roosevelt
- Current WEP/AOI results for Medicine Lake, Lostwood, Teddy Roosevelt

Excerpt from EPA's Guidance for RH SIP Development in the 2nd Planning Period (Pg. 8)

2. Step 2: Determination of affected Class I areas in other states

Section 51.308(f)(2) of the Regional Haze Rule requires each state to develop an LTS that includes the control measures necessary to make reasonable progress at each Class I area outside the state "that may be affected by emissions from the state."¹ This section addresses how a state determines which Class I areas in other states may be affected by its own emissions, so it knows which out-of-state Class I areas need to be considered in the development of its LTS. This linkage to specific Class I areas affects LTS development because baseline visibility impacts from individual sources and visibility benefits from possible emission control measures are specific to a Class I area. Also, section 51.308(f)(3) of the Regional Haze Rule provides that if a state contains sources whose emissions are reasonably anticipated to contribute to visibility impairment in a Class I area in another state for which the RPG is above the URP glidepath, the state must provide a "robust demonstration" that there are no additional emission reduction measures that would be reasonable to include in its own LTS.^{19 2}

As an initial matter, a state has the flexibility to use any reasonable method for quantifying the impacts of its own emissions on out-of-state Class I areas, and it may use any reasonable assessment for this determination. Additionally, since determinations of affected Class I areas were previously made for the first regional haze implementation period, states may consider retaining the same linkages and assumptions from those SIPs, but if states do so then they should consider whether the assumptions about source-receptor relationships have changed since those assessments.

States that are reassessing their linkages for the second implementation period may make this determination based on the state's recent emissions or anticipated emissions in 2028, which is the end of the second implementation period. Because visibility impairment is defined such that only anthropogenic emissions are considered to contribute to visibility impairment, all types of anthropogenic sources are to be included in this determination. States may also make this determination based on total statewide emissions.

¹ Section 51.308(f)(2) of the Regional Haze Rule also requires each state to develop an LTS that includes the control measures necessary to make reasonable progress at each of its own Class I areas. The qualification regarding "may be affected" applies only to out-of-state Class I areas; the state preparing a SIP revision must develop an LTS that includes measures necessary to make reasonable progress at each of its own Class I areas regardless of the impact from its own sources' emissions on those areas.

² See Section II.B.7.c of this document for additional information regarding the requirement for a robust demonstration.

A variety of technical, quantitative approaches exist to assess which out-of-state Class I areas may be affected by aggregate emissions from a given state. The most common approach in the first implementation period was to use a photochemical transport model to track the contribution due to emissions from whole states to specific Class I areas. This approach may also be used in the second implementation period, or a state may use another reasonable approach (e.g., back trajectory-based approaches).

A state with a Class I area may advise another state that it considers its Class I area to be affected by emissions from the other state. However, each state is responsible for its determination of what Class I areas may be affected by its emissions, regardless of impacts that a neighboring state might or might not have identified.³ This is also a suitable subject for interstate consultation. The Regional Haze Rule requires that states describe actions taken to resolve any disagreements and document interstate consultations.⁴

Excerpt from RHR – 40 CFR (f)(2)(ii):

(ii) The State must consult with those States that have emissions that are reasonably anticipated to contribute to visibility impairment in the mandatory Class I Federal area to develop coordinated emission management strategies containing the emission reductions necessary to make reasonable progress.

(A) The State must demonstrate that it has included in its implementation plan all measures agreed to during state-to-state consultations or a regional planning process, or measures that will provide equivalent visibility improvement.

(B) The State must consider the emission reduction measures identified by other States for their sources as being necessary to make reasonable progress in the mandatory Class I Federal area.

(C) In any situation in which a State cannot agree with another State on the emission reduction measures necessary to make reasonable progress in a mandatory Class I Federal area, the State must describe the actions taken to resolve the disagreement. In reviewing the State's implementation plan, the Administrator will take this information into account in determining whether the plan provides for reasonable progress at each mandatory Class I Federal area that is located in the State or that may be affected by emissions from the State. All substantive interstate consultations must be documented.” 40 CFR 51.308(f)(3)(ii)(B) Reasonable progress goals “If a State contains sources which are reasonably anticipated to contribute to visibility impairment in a mandatory Class I Federal area in another State for which a demonstration by the other State is required under (f)(3)(ii)(A), the State must demonstrate that there are no additional emission reduction measures for anthropogenic sources or groups of sources in the State that may reasonably be anticipated to contribute to visibility impairment in the Class I area that would be reasonable to include in its own long-term strategy. The State must provide a robust demonstration, including documenting the criteria used to determine which sources or groups or sources were evaluated and how the four factors required by paragraph (f)(2)(i) were taken into consideration in selecting the measures for inclusion in its longterm strategy.”

³ If the state preparing a SIP revision has no Class I areas of its own and it has demonstrated that there are no out of-state Class I areas that may be affected by its sources' emissions, we encourage the state to discuss this conclusion with their EPA Regional office.

⁴ 40 CFR 51.308(f)(2)(ii)(C).

Excerpt from MT Proposed FIP

TABLE 149—MT SOURCES EXTINCTION CONTRIBUTION 2000–2004, 20% WORST DAYS

	EC	2.75	5	33
	PM _{2.5}	0.9	2	22
	PM ₁₀	4.82	10	25
	Sea Salt	0.07	0	----

¹Contribution of sulfate and nitrate based on PSAT; OC, EC, PM_{2.5}, PM₁₀, and Sea Salt contribution based on WEP.

5. Consultation and Emissions Reduction for Other States' Class I Areas

40 CFR 51.308(d)(3)(i) requires that EPA consult with another state if Montana's emissions are reasonably anticipated to contribute to visibility impairment at that state's Class I area(s), and that EPA consult with other states if those other states' emissions are reasonably anticipated to contribute to visibility impairment at Montana's Class I areas. EPA worked with other states and tribes through the WRAP process. EPA also accepts and incorporates the WRAP-developed visibility modeling into the Regional Haze FIP for Montana. This proposal contains the necessary measures to meet Montana's share of the reasonable progress goals for the other state's Class I areas. Table 149 above shows Montana's contribution to Class I areas in neighboring states. None of the neighboring states with Class I areas have indicated to EPA that specific reductions are necessary for this FIP. Therefore, EPA proposes that this FIP meets Montana's share of the reasonable progress goals for the other state's Class I areas.

Stroh, David E.

Subject: RH SIP emissions inventory section discussion
Location: Microsoft Teams Meeting

Start: Mon 10/5/2020 2:30 PM
End: Mon 10/5/2020 3:30 PM

Recurrence: (none)

Meeting Status: Accepted

Organizer: Payne, Rhonda

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

UPDATE – Change to today? Hopefully this works!

I'd like to brainstorm with you about what the best way to organize the emissions inventory information into sections in the RH SIP.

The requirements for EIs are in this table:

RHR Requirements for an Emissions Inventory

RHR Rule Citation	RHR Description
Section 51.308(f)(2)(iii)	Identify the emissions information on which the state's strategies are based and explain how this information meets the RHR's requirements regarding the year(s) represented in the information to the NEI.
Section 51.308(f)(6)(v)	Requires states to submit a statewide inventory of emissions of pollutants that are reasonably anticipated to cause or contribute to visibility impairment in a Class I area. The inventory must include emissions for the most recent year for which data are available, and estimates for future projected emissions.
Paragraph 51.308(g)(4) of the Regional Haze Rule requires periodic progress reports to contain the following element:	An analysis tracking the change over the period since the period addressed in the most recent plan required under paragraph (f) of this section in emissions of pollutants contributing to visibility impairment from all sources and activities within the State.
Paragraph 51.308(g)(5) requires periodic progress reports to contain the following element:	An assessment of any significant changes in anthropogenic emissions within or outside the State that have occurred since the period addressed in the most recent plan required under paragraph (f) of this section including whether or not these changes in

RHR Rule Citation	RHR Description
	anthropogenic emissions were anticipated in that most recent plan and whether they have limited or impeded progress in reducing pollutant emissions and improving visibility.

There may be more requirements that I haven't listed.

David,

Thanks again for the discussion regarding North Dakota regional haze round 2 planning. I have attached the slide deck we covered. Feel free to pass this along to the appropriate personnel. As discussed, I will be keeping in touch later this month to schedule additional meetings.

In the meantime, should you or others have questions/comments regarding the slide deck, let me know and I can provide more information.

David

Trent and Jill,

Thank again for the discussion today and I apologize again for it taking ~2hrs versus the 1hr which was schedule for, but it was a great conversation!

Don't hesitate to reach out if you have any follow-up questions or comments. We look forward to working more with you as North Dakota's Round 2 Regional Haze SIP progresses.

Regards,
David

Good morning, David,

Thanks for sending me the info on your updated web page--it is very helpful.

Again, thanks for the excellent presentation yesterday.

Subject: [EXTERNAL] North Dakota - Four Factor Analysis Update

This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.

Hi Don,

As a follow-up to our discussion yesterday, I have made an update to the NDDEQ Regional Haze webpage. <https://www.deq.nd.gov/AQ/planning/RegHaze.aspx>

The update is specific to the North Dakota Progress section, Regional Haze Round 2 Files. Located toward the bottom of the webpage.

The data which used to be 2 separate Google drive folders has been consolidated into one document, Appendix B – Four Factor Information.

Direct link: https://www.deq.nd.gov/publications/AQ/Planning/RegionalHaze2/Appendix_B.pdf

Appendix B contains all the significant communications between NDDEQ and the sources regarding the four factor analysis. This Appendix is broken into 10 sections, B.1 – B.10. Each of these sections represents a facility which provided information per our request. These sections have been ‘bookmarked’ to ease navigation from report to report.

Of note per the discussion yesterday. Appendix B.1 contains the information received from Coyote Station. In 2020, the Department received 2 additional submittals from Coyote. One contains revisions to ‘SNCR and RRI costs’, and the other included revisions to the ‘SO2 controls analysis’.

Let me know if you have any questions or trouble accessing this information. Thank again for the discussion yesterday.
Regards,
David

Hi Hassan,

As a follow-up to my voicemail, I would like to gauge your interest in beginning state-to-state consultation. A couple items that come to mind are SIP submittal timelines and expectations, progress to date, and any input required from North Dakota to Minnesota or vice-versa for planning purposes.

Feel free to give me a call when you have time or respond via email and we can coordinate a time for discussion.

Hope you are doing well.

Subject: Montana's Regional Haze Determination on Impact of Facilities On Montana's Class I Areas

Hi Craig and Rhonda,

Under various sections of the Regional Haze regulation, states with Class I areas are required to develop reasonable progress goals (RPG) for visibility improvement at their Class I areas. When developing each Class I area RPG, states are required to consult with other states which may reasonably be anticipated to cause or contribute to visibility impairment in a Class I area. This email provides some general information and requests feedback from Montana.

Outside sources contributing to impairment in North Dakota Class I areas

Visibility in North Dakota's Class I areas is not significantly impaired by Montana sources on the most impaired days and Montana sources are not impeding North Dakota's ability to make reasonable progress during this planning period.

Therefore, North Dakota is not requesting the adoption of any controls or emission reduction measures from Montana during the second-planning period for the Regional Haze regulation.

North Dakota sources contributing to impairment in Montana Class I areas

North Dakota has reviewed the impacts our sectors have on visibility impairment in the Class I areas closest to North Dakota. This review indicated North Dakota sector contributions do not appear to be significantly impacting visibility in these Montana Class I areas (e.g. Medicine Lake “MELA1”) on the most impaired days. We believe this determination is supported by the Source Apportionment Charts provided by WRAP, specifically the “WRAP State Source Group Contributions - U.S. Anthro” (Tool 9 on the TSSv2, <https://views.cira.colostate.edu/tssv2/Express/ModelingTools.aspx> [\[views.cira.colostate.edu\]](https://views.cira.colostate.edu)). Should Montana disagree with this position, please notify North Dakota accordingly. Notification can be provided at any time, before or during the required public comment period.

This email provides an early opportunity for Montana to inform North Dakota of any expectations Montana has regarding North Dakota’s Regional Haze SIP for round 2 of the planning process.

Thank you in advance for your participation in this consultation process.

Please contact me at 701-328-5229 or destroh@nd.gov should you require additional information on this matter.

Regards,

David

Hi Hassan,

Following up on my voicemail. Under various sections of the Regional Haze regulation, states with Class I areas are required to develop reasonable progress goals (RPG) for visibility improvement at their Class I areas. When developing each Class I area RPG, states are required to consult with other states which may reasonably be anticipated to cause or contribute to visibility impairment in a Class I area. This email provides some general information and requests feedback from Minnesota.

Outside sources contributing to impairment in North Dakota Class I areas

Visibility in North Dakota's Class I areas is not significantly impaired by Minnesota sources on the most impaired days and Minnesota sources are not impeding North Dakota's ability to make reasonable progress during this planning period. Therefore, North Dakota is not requesting the adoption of any controls or emission reduction measures from Minnesota during the second-planning period for the Regional Haze regulation.

North Dakota sources contributing to impairment in Minnesota Class I areas

North Dakota has reviewed the impacts our sectors have on visibility impairment in the Class I areas closest to North Dakota. This review indicated North Dakota sector contributions do not appear to be significantly impacting visibility in these Minnesota Class I areas (e.g. Voyageurs NP “VOYA2”) on the most impaired days. We believe our determination is supported by the Source Apportionment Charts provided by WRAP, specifically the “WRAP State Source Group Contributions - U.S. Anthro” (Tool 9 on the TSSv2, <https://views.cira.colostate.edu/tssv2/Express/ModelingTools.aspx>). Should Minnesota disagree with this position, please notify North Dakota accordingly. Notification can be provided at any time, before or during the required public comment period. This email provides an early opportunity for Minnesota to inform North Dakota of any expectations Minnesota has regarding North Dakota’s Regional Haze SIP for round 2 of the planning process.

Thank you in advance for your participation in this consultation process.

Please contact me at 701-328-5229 or destroh@nd.gov should you require additional information on this matter.

Regards,
David

All,

I have attached the PP we will be covering today. I plan to screenshare, walkthrough the PP, and we can have an open discussion on the material.

Scott – thanks for the heads up

David

Hi all,

I have a doctor's appt. during this time so I'm unable to make it. I will follow up with Jaslyn and Aaron to see how it went.

Scott

Scott Jackson

Subject: North Dakota and EPA R8 Regional Haze Discussion
When: Thursday, July 8, 2021 10:00 AM-11:00 AM (UTC-07:00) Mountain Time (US & Canada).
Where: Microsoft Teams Meeting

Hi all,

Aaron and I spoke this morning regarding North Dakota, regional haze, and the upcoming work/SIP submittal (thanks for the good discussion, Aaron). We felt convening as a group to discuss North Dakota's current draft plan was a good idea. As your schedule allows, please join in the discussion set for July 8th. Feel free to pass along this invite to other EPA staff as you see fit.

I am planning to pull together some slides together for our discussion and will share the in advance of this call.

In the meantime, let me know if you have any questions or comments.

Regards,

David

BART for Coal Creek Station

- Great River Energy is selling CCS to Rainbow Energy Center
- Round 1 NOx BART
 - Low NOx burners in conjunction with DryFinishingTM and expanded overfire air registers (LNC3+)
 - U1 and U2 have LNC3+ installed (2020 and 2010, respectively)
 - Proposed limit of 0.15 lb/MMBtu (30-day r.a.)

Five-year Progress Report

- Original submitted in January 2015
- Update included with RH SIP revision
 - Requirements of 40 CFR 51.308(g)
- 40 CFR 51.308(h) “*adequacy of existing implementation plan*”
 - For Progress reports, statement to be included with this SIP revision.

Timeline and Next Steps

- Finish internal review
- 60-day formal FLM consultation period
 - Summarize/Incorporate comments
- 30-day public comment period
 - Hold public hearing
 - Respond to comments
- Route to Governor's Office for signature
- Submit

North Dakota Current Actions

- Upstream Oil and Gas
- Hess TGP
- Project Tundra
- Dakota Gasification Company
- Heskett Station Coal Closure (NG switch)

Regional Haze Contacts:

Following is an email we received from EPA regarding the proper interest rate to use in the Regional Haze four-factors economic analysis. Based on EPA's guidance, the Department believes the interest rate should not exceed 5.25%.

Also, attached is guidance that EPA provided for determining the "most impaired" days and adjusting the glidepath for international sources.

If you have any questions, please feel free to contact David Stroh, Angela Seligman or me.

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

Hi Tom-

The interest rate recommended by EPA can vary by firm or industry, but the bank prime rate is a default rate that can be used for annualization of capital costs. The most recent bank prime rate (currently ~5.25%) can be found on the Federal Reserve website here:

<https://www.federalreserve.gov/releases/h15/>

Also, consult the somewhat recently revised Cost Estimation chapter of EPA's Control Cost Manual. See discussion of the bank prime rate in Section 2.5.2, Interest Rates:

https://www.epa.gov/sites/production/files/2017-12/documents/epacmcostestimationmethodchapter_7thedition_2017.pdf

I hope that is helpful.

Happy Holidays!

Aaron

Subject: Regional Haze Economic Analyses

Aaron/Jaslyn:

Now that our sources are working on four-factor analyses (and GRE is contemplating a revised BART analysis for Coal Creek Station), a question regarding the analysis has come up. That is – what is the appropriate interest rate to be used in the economic analysis to determine annualized costs? In the past we have generally used 7%; however some analyses used a lower value. Given current low interest rates, is 7% still valid?

Any information you can provide will be appreciated!

Appendix F – Coal Creek Station NOx BART

F.1 – NOx BART analysis for Coal Creek Station Unit 1 and Unit 2

1 Introduction and Representative Operations

Coal Creek Station (CCS) is a two-unit, approximately 1,200 gross MW mine-mouth power plant consisting primarily of two steam generators and associated coal and ash handling systems. Unit 1 and Unit 2 are identical Combustion Engineering boilers firing pulverized lignite coal tangentially. Unit 1 has a heat input capacity of 6,015 MMBtu/hr; Unit 2 has a heat input capacity of 6,022 MMBtu/hr.

Unit 1 began commercial operation in 1979. Unit 2 began commercial operation in 1980. The facility is located in south central McLean County about five miles south of the town of Underwood, North Dakota and three miles west of US Highway 83. CCS receives its lignite coal from the Falkirk Mine that is operated by the Falkirk Mining Company, which is a subsidiary of the North American Coal Corporation. The average annual amount of North Dakota lignite coal combusted from 2009 through 2018 was 7.2 million tons. See Table 1 for detailed information.

Table 1: Yearly Coal Combusted (tons)

Year	Unit 1 (tons)	Unit 2 (tons)
2009	4,095,584	3,941,997
2010	3,835,877	3,284,752
2011	4,371,455	4,801,722
2012	3,645,837	3,579,986
2013	3,623,564	3,304,313
2014	3,407,090	3,528,472
2015	3,439,201	3,446,814
2016	3,355,393	2,862,056
2017	2,752,937	3,394,443
2018	3,750,337	3,667,824
Average	3,627,728	3,581,238
Combined Average	7,208,966	

Over the same 10-year period (2009–2018), CCS operated at an 87% annual capacity factor, as determined on an actual heat input basis. Future operations are expected to be consistent with this 10-year period and the 87% annual capacity factor was used when calculating the baseline and future projected emissions discussed in Section 2.

Table 2 displays the operational information from 2009–2018. The Annual Capacity Factor is calculated by dividing the actual heat input by the maximum potential heat input for Unit 1 (52.69×10^6 MMBtu/yr) and Unit 2 (52.75×10^6 MMBtu/yr).

Table 2: Utilization and Annual Capacity Factor

Year	Unit 1 Heat Input MMBtu/yr	Unit 2 Heat Input MMBtu/yr	Unit 1 Annual Capacity Factor	Unit 2 Annual Capacity Factor
2009	49,625,416	48,220,581	0.94	0.91
2010	49,409,811	41,998,558	0.94	0.80

Year	Unit 1 Heat Input MMBtu/yr	Unit 2 Heat Input MMBtu/yr	Unit 1 Annual Capacity Factor	Unit 2 Annual Capacity Factor
2011	43,014,802	46,942,626	0.82	0.89
2012	48,676,811	47,951,409	0.92	0.91
2013	48,686,810	43,924,548	0.92	0.83
2014	46,286,312	46,530,063	0.88	0.88
2015	47,059,790	46,053,317	0.89	0.87
2016	45,437,239	38,498,049	0.86	0.73
2017	37,327,033	44,826,636	0.71	0.85
2018	48,250,097	47,761,484	0.92	0.91
Average	46,377,412	45,270,727	0.88	0.86
		Combined Average	0.87	

2 NOx Emissions Controls and History

2.1 Existing NOx Controls

The NOx controls currently installed at CCS Units 1 and 2 consist of the following:

- 1) LNC3 (combination of closed coupled overfired air, separated overfired air, and low NOx burners) is installed on Units 1 and 2. This technology is considered as part of the baseline emission calculation discussed in Section 2.2.
- 2) DryFining™ technology has been installed and operating on Units 1 and 2 since 2010. DryFining™ is an innovative technology developed by Great River Energy that reduces moisture and refines lignite coal. The technology increases the efficiency and performance of the fuel while reducing emissions. This technology is considered part of the baseline emissions discussed in Section 2.2. Units 1 and 2 have experienced approximately 0.02 lb NOx/MMBtu of reductions since completion of DryFining™.
- 3) LNC3+ (LNC3 with expanded overfired air registers in conjunction with DryFining™) was installed on Unit 2 in 2007. Expanded overfired air was completed in 2007 with DryFining™ coming online in 2010. Collectively, LNC3+ became fully operational on Unit 2 in 2010. Unit 1 had expanded overfired air registers installed in the second quarter of 2020. Unit 1 is LNC3+ is expected to operate with a similar NOx profile as the LNC3+ on Unit 2.

2.2 Historical and Future Anticipated Emissions

For the purposes of this BART determination, the Department considered the operation of LNC3 with DryFining™ technology as the baseline control technology for Units 1 and 2. Even though LNC3+ (expanded overfired air registers with DryFining™) has been operational on Unit 2 since 2010 and was installed on Unit 1 in 2020, the Department found it most appropriate to perform the BART determination as if LNC3+ is not installed on either unit. This is consistent with the EPA response to comments set forth in the Federal Implementation Plan created for North Dakota (77 FR 20893):

“We evaluate potential control options based on baseline conditions, not on ongoing revisions to a facility after the baseline period. It is not reasonable to consider controls installed after the baseline period in determining BART. Such an approach would tend to lead to higher cost effectiveness values for more effective controls and encourage sources to voluntarily install lesser controls to avoid installing more effective BART controls later.”¹

This above response is still applicable, but requires additional context given the amount of time which has passed and the reductions of NOx emissions from the source over this time. To demonstrate the impact LNC3+ had on the average NOx emissions for Unit 2, the Department reviewed the five-year annual average performance rates preceding the installation of LNC3+. From 2002 through 2006, the annual average NOx performance rate in pounds per MMBtu for Units 1 and 2 was 0.22 and 0.23, respectively. The similarity of this five-year average supports the notion that Unit 1 and Unit 2 operate nearly identically with similar controls. The differences in performance rates between Unit 1 and Unit 2 since that time period can be attributed to the installation of LNC3+. This also demonstrates that Unit 1 will be able to achieve a similar annual NOx performance as Unit 2.

CCS installed LNC3+ on Unit 2 in 2010 and on Unit 1 in 2020 in advance of being required through an approved regional haze SIP amendment. As a result of CCS installing LNC3+ on Unit 2, approximately 11,700 tons of NOx emissions reductions occurred at CCS from 2010–2018. These reductions would not have occurred without the installation of LNC3+. Table 3 displays this information.

Table 3: Annual NOx Emissions since 2010

Year	Unit 1 Configuration LNC3^A (NOx Tons)	Unit 2 Configuration LNC3+ (NOx Tons)	Difference
2010	5,199	3,473	1,726
2011	4,398	3,580	818
2012	5,102	3,556	1,547
2013	4,692	3,320	1,373
2014	4,697	3,287	1,410
2015	5,087	3,499	1,588
2016	4,327	2,564	1,763
2017	3,361	2,889	472
2018	3,985	3,010	976
Total NOx:	40,848	29,176	11,673

^A LNC3 with DryFinishing™

Reducing NOx emissions through combustion upgrades (e.g. LNC3+) in advance of installing add-on post combustion controls (e.g. SNCR or SCR) is always recommended as the first step. Fundamentally, it is better to produce less NOx during the combustion process than it is to add-on post combustion pollution controls to remove NOx after formation. This reduces the equipment size and the associated operational and maintenance costs of the add-on controls. CCS has already taken

¹ Available at: <https://www.federalregister.gov/d/2012-6586/p-547>

the step to install LNC3+ on both Units. As is described in the EPA response to comments above, the installation of LNC3+ was voluntary and not required by the Department. Therefore, it should not be used in the baseline emissions. However, LNC3+ may still be selected as the appropriate BART control for both Unit 1 and Unit 2. As this BART determination demonstrates, CCS installed NOx BART controls on Unit 2 in 2010 and installed NOx BART controls on Unit 1 in 2020 with the installation of LNC3+.

The 2016–2018 three-year annual average data from LNC3 (with DryFining™) on Unit 1 and LNC3+ on Unit 2 is displayed in Table 4. Table 4 LNC3 data for Unit 1 is used as the baseline performance rate in pounds of NOx per MMBtu for both units. Table 4 LNC3+ data for Unit 2 is used as the first option of additional controls for evaluation in the current BART determination for both units. This is unique from other BART determinations because the first option of additional control is based on actual performance data from Unit 2 and not on anticipated future performance rates (like the remaining add-on control options evaluated in Section 3.1).

Table 4: Three-year NOx performance rate in lb NOx/MMBtu

Year	Unit 1 (LNC3 with DryFining™)	Unit 2 (LNC3+)
2016	0.193	0.136
2017	0.182	0.130
2018	0.166	0.126
Average	0.180	0.131

As shown in Table 4, the 3-year average NOx performance rate from Unit 1 is 0.18 lb NOx/MMBtu; this is used as the baseline performance rate for Unit 1 and Unit 2. Also shown in Table 4, the Unit 2 LNC3+ 3-year average performance rate is 0.13 lb NOx/MMBtu; this is used as the performance rate for first option of BART controls.

A benefit to taking this approach is that the Department has actual operational data reflecting the impact LNC3+ has on reducing the formation of NOx emissions at CCS, relative to LNC3. Since Unit 1 and Unit 2 are identical units, the future anticipated performance rate for LNC3+ on Unit 1 is based on actual data from Unit 2. Table 5 displays the baseline NOx emissions scenario and the tons associated with the first control option (LNC3+). Note: values displayed are for a single unit.

Table 5: Unit 1 and Unit 2 Baseline Emissions and Control Option 1

Control Scenario	Control Technology	Emissions (tons/year)
Baseline	LNC3 with DryFining™	4,143
Option 1	LNC3+	2,980

3 NOx BART Determination for Unit 1 and Unit 2

The following determination was derived using combined average historical data for both units and using the data to make a single BART determination, which applies to both units. A single NOx BART determination is made because Unit 1 and Unit 2 are identical boilers and have historically operated consistently, as discussed in Section 2.2.

3.1 Step 1 – Identify All Available Retrofit Control Technologies

The BART controls that were evaluated for CCS are listed in Table 6. Each control technology is listed along with its associated performance rate and total expected emissions on a yearly basis. Expected emissions were calculated using the performance rate, the potential heat input, and the annual capacity factor (Table 2).

Table 6: NO_x BART Control Options

Control Technology	Control Technology Abbreviation	Emission Rate (lb/MMBtu) ^A	Emissions (tons/year)
low NO _x burners with closed coupled overfired air	LNC3 ^B	0.18	4,143 ^C
LNC3 with expanded overfired air registers in conjunction with DryFinishing TM	LNC3+	0.13	2,980
LNC3+ with selective non-catalytic reduction	LNC3+ w/SNCR	0.10	2,293
LNC3+ with selective catalytic reduction	LNC3+ w/SCR	0.08-0.06	1,830-1,380

^A Emission rates for LNC3 and LNC3+ from Unit 1 and Unit 2 are annual average data from 2016—2018, see Table 4. SNCR and SCR emission rates reflect the expected annual average achievable rate.

^B The emission rate for LNC3 includes the DryFinishingTM operation

^C $0.18 \text{ lb NO}_x/\text{MMBtu} \times 52.72 \times 10^6 \text{ MMBtu/yr} \times 0.87 / 2000 = 4,140 \text{ tons NO}_x/\text{year}$

LNC3+ was evaluated as an additional control option to reduce the formation of NO_x during the combustion process. Selective non-catalytic reduction (SNCR) and selective catalytic reduction (SCR) were both evaluated as potentially available add-on controls to reduce NO_x emissions post combustion.

The control technologies evaluated in Table 6 for reducing NO_x emissions are consistent with the technologies evaluated for the other North Dakota lignite-fired electrical generating utilities² and with the BART guidelines.³

3.2 Step 2 – Evaluate Technically Feasible Control Technologies

- 1) LNC3+ is technically feasible and is currently installed and operational on Unit 1 and Unit 2. LNC3+ was installed on Unit 2 in 2010 and was installed on Unit 1 in 2020.
- 2) SNCR is a type of post combustion add-on control equipment. SNCR is technically feasible for both units at CCS and was reviewed as a potential additional control option after LNC3+ installation.
- 3) SCR is a type of post combustion add-on control equipment. The technical feasibility of SCR is uncertain at CCS. SCR was reviewed as a potential additional control option after LNC3+

² Available at: <https://www.federalregister.gov/documents/2012/04/06/2012-6586/approval-and-promulgation-of-implementation-plans-north-dakota-regional-haze-state-implementation>

³ 40 CFR Part 51 Appendix Y, Guidelines for BART Determinations under the Regional Haze Rule.

installation. SCR was evaluated based on two potential arrangements, including a “high-dust” and “low-dust” system. High-dust systems are located upstream of the particulate controls (electrostatic precipitator) and low-dust systems are located downstream of the particulate controls.

- a. High-dust SCR systems have significant potential for catalyst surface plugging due to the high sodium concentrations in the lignite coal used at CCS. Additionally, without the completion of pilot testing, the SCR catalyst supplier was unable to ensure reliable performance and catalyst life given the significant uncertainty with potential plugging and catalyst deactivation.⁴ For these reasons, a high-dust SCR system is determined to be technically infeasible. This is consistent with the Department’s 2009 determination that high-dust SCR is not technically feasible for Units combusting North Dakota lignite coal.⁵
- b. Low-dust SCR systems (including tail-end SCR) are located downstream of the electrostatic precipitator where most of the sodium-bearing fly ash particles are expected to be removed, potentially mitigating the issue of SCR catalyst plugging.⁶ The catalyst vendor, IBDEM Ceram, and the SNCR/SCR vendor, Fuel Tech, both expressed overall concerns with North Dakota lignite coal impacts on the SCR catalyst plugging and fouling. Both independently recommended pilot scale testing be completed to obtain actual performance data and determine catalyst impacts.^{7,8} Without consideration of the recommended pilot testing, a low-dust system potentially removes the concern with technical feasibility in relation to catalyst plugging. Therefore, a low-dust SCR system is determined to be technically feasible and is carried forward for further evaluation.⁹

3.3 Step 3 – Evaluate Control Effectiveness

The efficiency of the BART controls, anticipated performance rates, and the projected emission reductions for each control option are listed in Table 7. The projected emissions reductions listed in Table 7 would occur at each unit (e.g. SNCR would reduce NO_x emissions by 1,850 tons per year from both Unit 1 and Unit 2, totaling 3,700 tons per year, beyond the baseline emissions).

Table 7: Control Effectiveness and Emissions Reductions

Control Technology	Emission Rate (lb/MMBtu)	Control Efficiency	Emission Reduction (tons/year)
Baseline, LNC3 ¹	0.18	--	--
LNC3+	0.13	28%	1,163

⁴ Appendix B.4.b, p. 16-19. PDF pages 596-599.

⁶ Appendix B.4.b, p. 16. PDF page 596.

⁷ Appendix B.4.b, Attachment A, pages 2-15 to 2-17. PDF pages 642-644.

⁸ Appendix B.4.b, Attachment A, Appendix E. PDF page 696.

⁹ Appendix B.4.b, p. 17. PDF page 597.

Control Technology	Emission Rate (lb/MMBtu)	Control Efficiency	Emission Reduction (tons/year)
LNC3+ w/SNCR	0.10	45%	1,850
LNC3+ w/SCR	0.08-0.06	56%-67%	2,310-2,770

¹ The emission rate for LNC3 includes the DryFining™ operation

Within the Updated BART Analysis, a range of performance rates for SCR were evaluated, which is why the information in Table 7 includes a range of options for SCR. The performance rates evaluated are consistent with currently available information for units operating SCRs.¹⁰ These anticipated performance rates ranged from 0.04 to 0.08 lb NO_x per MMBtu. The performance rate of 0.04 lb NO_x per MMBtu is not listed in Table 7 due to significant uncertainty that this rate could be achieved in practice and sustained for an extended timeframe.^{11,12} Therefore, the Department will not evaluate SCR at a performance rate of 0.04 lb NO_x per MMBtu for the purposes of this BART determination. Information presented throughout the remainder of this BART determination is specific to SCR at a performance rate of 0.06 and 0.08 lb NO_x per MMBtu.

3.4 Step 4 – Evaluate Impacts

3.4.1 Cost of Compliance

The cost of compliance and incremental cost for the BART controls are listed in Table 8 for a single unit. The incremental costs displayed in Table 8 were determined from LNC3+ to SNCR and from LNC3+ to SCR. The incremental cost between SNCR and SCR is not shown in Table 8 due to the high annualized cost difference in conjunction with a limited improvement in emissions reduction.

Table 8: Cost of Compliance and Incremental Cost of Compliance

Control Technology	Performance Level (lb/MMBtu)	Annual Emission Reduction (tpy)	Annualized Total Cost (\$)	Cost of Compliance (\$/ton)	Incremental Cost of Compliance (\$/ton)	Incremental Cost of SCR over SNCR (\$/ton)
Baseline, LNC3	0.18	--	--	--	--	--
LNC3+	0.13	1,162	793,418	683	--	--
LNC3+ w/SNCR	0.10	1,850	6,194,244	3,348	7,850	--
LNC3+ w/SCR	0.08	2,309	16,122,491	6,983	13,368	21,645
LNC3+ w/SCR	0.06	2,767	17,391,169	6,284	10,339	12,206

A detailed breakdown of the costs listed in Table 8 can be found in the Updated BART Analysis.¹³ The Department has reviewed these costs and believes them to be accurate.

¹⁰ Appendix B.4.b, p. 17-18. PDF pages 597-598.

¹¹ Appendix B.4.b, p. 18-19. PDF pages 598-599.

¹² Appendix B.4.b, Attachment A, page 2-12 and 3-1. PDF pages 639 and 649.

¹³ Appendix B.4.b, PDF pages 690-694, 780-800, 923-946.

As displayed in Table 8, the cost of compliance for the installation of LNC3+ at CCS is \$700 per ton of NO_x reduced. This represents a 0.05 lb NO_x per MMBtu improvement over the baseline performance rate and results in an annual reduction of over 1,100 tons of NO_x per unit.

If SNCR is installed along with LNC3+, a performance rate improvement of 0.03 lb NO_x per MMBtu could be achieved. This equates to an additional reduction of approximately 700 tons of NO_x per year for each unit. To provide the most conservative cost of compliance (i.e., the lowest dollar per ton of pollutant reduction) for SNCR, Table 8 does not include additional costs associated with the treating of ammoniated fly-ash or the additional cost incurred due to the loss of a saleable by-product, which would result in an increase in fly-ash disposal.¹⁴ There is also uncertainty in the amount of saleable by-product that would be lost and the limited commercial application of the treating process; both of which are required to better understand the impacts a treating system would have at CCS.¹⁵ Without this information, the ultimate cost of SNCR is unknown. Without taking these costs into consideration, the cost of compliance to concurrently install LNC3+ with SNCR is \$3,300 per ton of NO_x reduced.

To determine the appropriate BART controls when comparing between the installation of only LNC3+ and the installation of LNC3+ with SNCR, the Department calculated the stand-alone cost of installing SNCR after LNC3+ is installed. This stand-alone cost is referred to as the incremental cost of compliance or the incremental cost effectiveness in the BART guidelines.¹⁶ Incremental cost is a key factor to consider when selecting BART controls since it details the cost effectiveness specific to the SNCR. The incremental cost of compliance was determined to be \$7,800 per ton of NO_x reduced. Therefore, even though the cost of compliance for LNC3+ with SNCR listed in Table 8 appears reasonable at \$3,300 per ton, it is more accurate to represent the cost of LNC3+ at \$700 per ton and the cost of SNCR after the installation of LNC3+ at \$7,800 per ton. The Department believes \$7,800 is an unreasonably high cost, especially in consideration of the potential increased costs through the installation of a fly-ash treating system, lost fly-ash sales, and the technological uncertainty with the treating system viability at CCS. Between LNC3+ and LNC3+ with SNCR, LNC3+ is the most appropriate BART control from the perspective of cost feasibility.

All costs associated with the SCRs are provided for the high-dust arrangement. High-dust systems are generally considered more economical than low-dust systems since less equipment is required during operation. Exhaust gas re-heat and cooling systems are among the additional costs required with low-dust SCR systems.^{17,18} The cost of compliance will increase significantly with the additional equipment needed for a low-dust SCR system.¹⁹ Without taking these added costs into consideration, the cost to install LNC3+ concurrently with SCR is (at a minimum) \$6,300 per ton of NO_x reduced. Using the same logic applied in the SNCR discussion in the above paragraph, the incremental cost to install SCR after LNC3+ is \$10,300 per ton. Additionally, for consistency with the

¹⁴ Appendix B.4.b, p. 25-26. PDF pages 605-606.

¹⁸ Appendix B.4.b, Attachment A, page 2-16. PDF page 643.

¹⁹ Appendix B.4.b, Attachment A, Appendix B. PDF page 684.

BART guidelines²⁰, the Department calculated the incremental cost between SNCR and SCR. This resulted in incremental costs of \$12,200 and \$21,600 per ton for SCR evaluated at 0.06 and 0.08 lb NO_x per MMBtu, respectively. The Department believes all these costs are unreasonably high, especially in consideration of the technological uncertainty with SCR and the added costs associated with the exhaust reheat and cooling systems.

3.4.2 Energy and Non-air Quality Environmental Impacts

LNC3+ is determined to have negligible energy and/or non-air quality environmental impacts. LNC3+ technology reduces the formation of NO_x during the combustion process and does not affect items such as: auxiliary power consumption, water usage, potential fly ash sales, and/or ammonia slip, which are all potential impacts associated with SNCR and/or SCR.

The largest potential non-air quality environmental impact with SNCR is the potential for producing ammoniated fly-ash, which could inhibit or severely limit CCS from selling fly-ash for beneficial use (e.g. concrete additive).²¹ This ammoniated fly-ash has the largest impact on non-air quality environmental impacts since ammoniated fly-ash not being sold for beneficial use could end up significantly increasing the amount of fly-ash disposed of in landfills. The production of ammoniated fly-ash also reduces any economic benefit CCS receives from selling this by-product. SNCR also requires a significant increase in water consumption for the injection skid. Additionally, ammonia slip from the SNCR will likely result in nitrogen being carried through the scrubber water that is routed to the evaporation ponds, causing potential issues with pond maintenance.²²

Low-dust SCR has the same potential non-air quality environmental impacts as SNCR regarding increased water consumption and ammonia slip. There is also increased power and fuel consumption required with SCR related equipment and from the gas reheat and cooling systems.²³

The non-air quality environmental impacts for SNCR and SCR are significant, but not significant enough to eliminate them as a control option.

3.4.3 Remaining Useful Life

Coal Creek Station is expected to operate beyond the life of the control equipment²⁴, therefore, remaining useful life was not considered. For cost purposes, the lifetimes of the evaluated technologies are consistent with EPA defined defaults for SCR (30 years) and SNCR (20 years).

3.5 Step 5 – Evaluate Visibility Impacts

CCS conducted dispersion modeling to assess the potential visibility improvement from the use of add-on NO_x controls. The modeling was conducted in accordance with the “Protocol for BART-

²⁰ Calculate the incremental cost effectiveness for each dominant option, which is the difference in total annual costs between that option and the next most stringent option, divided by the difference in emissions, after controls have been applied, between those two control options.

²¹ Appendix B.4.b, Attachment B. PDF page 837.

²² Appendix B.4.b, Attachment A, p. 4-23. PDF page 674.

Related Visibility Impairment Modeling Analysis, Great River Energy Coal Creek Station” approved by EPA Region 8 on August 7, 2019.²⁵

The first modeled scenario (Model Scenario 0) in Table 9 was performed to establish the baseline visibility impairment on North Dakota’s Class I Areas from 2000–2002 (pre-BART controls for all pollutants). Model Scenario 1 reflects the post-SO₂ BART approved controls and associated emission rates. The remaining modeling scenarios (Model Scenarios 2 through 6) reflect the application of the potential NO_x BART controls evaluated in this BART Determination.²⁶ It is important to note that CCS was required to perform modifications to the wet gas scrubber in order to reduce sulfur dioxide (SO₂) emissions as required by the earlier partially approved Regional Haze SIP.²⁷ No particulate matter (PM) controls were required in the partially approved Regional Haze SIP; however, the enhanced SO₂ controls had a beneficial impact on reducing PM emissions. This information is summarized in Table 9.

Table 9: Emissions Rates Modeled for Determination of Visibility Impact

Modeling Scenario	NO_x Control Technology	NO_x Emissions Rate (lb/hr)^A	SO₂ Control Technology	SO₂ Emissions Rate (lb/hr)^A	PM Emissions Rate (lb/hr)^{A,B}
0	LNC3	1797	Pre-BART	5351	233
1	LNC3 (with DryFining TM)	1233	Post-BART	967	90
2	LNC3+	898	Post-BART	967	90
3	LNC3+ w/SNCR	695	Post-BART	967	90
4	LNC3+ w/SCR (0.06) ^{C, D}	415	Post-BART	967	199
5	LNC3+ w/SCR (0.06) ^{C, E}	415	Post-BART	967	141
6	LNC3+ w/SCR (0.06) ^{C, F}	415	Post-BART	967	90

^A Maximum 24-hour emissions rate in pounds, averaged between both units

^B No particulate matter controls were selected as BART, decrease from Scenario 0 to 1 resulted from SO₂ BART

^C Refers to an anticipated annual NO_x performance level of 0.06 lb/MMBtu

^D Additional 109 lb/hr PM results from anticipated sulfuric acid formation from SCR; 5% SO₂ to SO₃ oxidation rate

^E Additional 51 lb/hr PM results from anticipated sulfuric acid formation from SCR; 2.5% SO₂ to SO₃ oxidation rate

^F No anticipated sulfuric acid formation from SCR; 0% SO₂ to SO₃ oxidation rate

In Table 9, the reason for the increase in PM emissions from Model Scenario 3 to 4 is from the anticipated sulfuric acid mist formation from SCR application. This anticipated increase results from an SO₂ to SO₃ oxidation rate of 5%.²⁸ The reason for the high oxidation rate is due to the uncertainty regarding the technical feasibility of SCR on units that combust North Dakota lignite coal and the high boiler flue gas temperatures at CCS. Given the uncertainty, the Department believes the 5%

²⁵ Appendix B.4.b, Attachment E. PDF pages 911-917.

²⁶ Appendix B.4.b, p. 27-28. PDF pages 607-608.

²⁷ Available at: <https://www.federalregister.gov/documents/2012/04/06/2012-6586/approval-and-promulgation-of-implementation-plans-north-dakota-regional-haze-state-implementation>

²⁸ Appendix B.4.b, Attachment A, Appendix E, p. 2. PDF page 697.

oxidation rate provided by the SCR catalyst vendor is the most appropriate value to use for this BART determination. However, since the 5% SO₂ to SO₃ oxidation rate is outside the range of what is typically expected²⁹, a recommendation was made to conduct additional modeling using more conservative (lower) SO₂ to SO₃ oxidation rates. Therefore, CCS conducted additional modeling using lower SO₂ to SO₃ oxidation rates of 0% and 2.5%. This modeling was performed to evaluate the potential change in visibility by lowering the SO₂ to SO₃ oxidation rate. This additional modeling was provided to the Department in a report dated February 27, 2020, “Coal Creek Station BART for NO_x Emissions – Visibility Impairment Modeling Results for Additional SCR SO₂ Oxidation Scenarios”, which is included as Appendix F.3. This report also provides additional technical details that support the uncertainty of the SO₂ to SO₃ oxidation rate.

As discussed in Section 3.3, the performance level for SCR installation on North Dakota lignite-fired units is uncertain and was provided at three performance rates (0.04, 0.06, and 0.08 lb NO_x per MMBtu). Due to the uncertainty in sustaining the 0.04 lb NO_x per MMBtu performance rate, the Department did not consider the visibility results from the modeling associated with this rate. For informational purposes, these results are available in Appendix F.3.³⁰ With the information currently available, the Department has determined 0.06 lb NO_x per MMBtu as the lowest sustainable performance rate for SCR at CCS. In turn, modeling the projected maximum pounds of NO_x emitted per 24-hours in association with the performance rate of 0.06 lb NO_x per MMBtu will result in the largest potential improvement on visibility (i.e. 0.08 lb NO_x per MMBtu modeling would only show less of a visibility improvement).

Before determining the potential visibility improvements for the NO_x BART controls evaluated, baseline visibility impairment was established. A baseline visibility impairment was established for Model Scenarios 0 and 1. As is shown in Table 9, Model Scenario 0 uses pre-BART emissions data for NO_x, SO₂, and PM. Model Scenario 1 uses post-SO₂ BART SO₂ and PM emissions data in addition to the collective impact DryFinishingTM had on SO₂, PM, and NO_x emissions. Model Scenario 0 visibility impairment is shown in Table 10 and Model Scenario 1 visibility impairment is shown in Table 11. These Tables show the maximum impairment on visibility for the 98th percentile at each of the North Dakota Class I Areas. The Class I areas in North Dakota are Theodore Roosevelt National Park (TRNP) and Lostwood National Wildlife Refuge (Lostwood). TRNP consists of the South Unit, the North Unit, and the Elkhorn Ranch.

Table 10: Model Scenario 0 Baseline Visibility Impairment in Deciviews

Year	TRNP South Unit	TRNP North Unit	TRNP Elkhorn Ranch	Lostwood
2000	1.96	1.78	1.41	2.16
2001	1.65	1.38	1.63	2.84
2002	3.13	2.69	2.17	1.98

²⁹ Appendix B.4.b, Attachment H-1, p. 3-2. PDF page 968.

³⁰ Appendix F.3, Tables 1 through 12a.

As shown in Table 10, the maximum potential visibility impairment for Model Scenario 0 occurs in calendar year 2002 and is 3.13 deciviews at TRNP South Unit. This is the pre-BART and pre-DryFinishing™ controls baseline.

Table 11: Model Scenario 1 Baseline Visibility Impairment in Deciviews

Year	TRNP South Unit	TRNP North Unit	TRNP Elkhorn Ranch	Lostwood
2000	0.66	0.65	0.60	0.92
2001	0.47	0.57	0.53	0.87
2002	1.28	1.15	0.99	0.69

As shown in Table 11, the maximum potential visibility impairment for Model Scenario 1 occurs in calendar year 2002 and is 1.28 deciviews at TRNP South Unit. The largest difference in visibility impairment from Model Scenario 0 to 1 is in year 2001 at Lostwood and is a difference of 1.97 deciviews. The difference of 1.97 deciviews is the maximum calculated visibility improvement resulting from SO₂ BART controls in conjunction with DryFinishing™. Model Scenario 1 is the current baseline scenario.

Once the current baseline visibility impairment was established, the potential visibility improvements, in deciviews, were determined. The potential difference in visibility impairment between model scenarios is the calculated visibility improvement associated with the implementation of the NO_x control technology. The visibility improvements for the BART controls evaluated in Table 9 have been summarized for each year (2000, 2001, and 2002) in Table 12, Table 13, and Table 14, respectively. The average visibility improvements from 2000–2002 are shown in Table 15. Each table shows the maximum improvement in visibility for the 98th percentile at each of the North Dakota Class I Areas. The maximum improvement in visibility is on a facility basis. Since Unit 1 and Unit 2 are identical units, individual (or per unit) visibility improvements can be determined by simply attributing half of the deciview improvement to each unit. For example, Model Scenario 1 in Table 12 for TRNP South Unit indicates a combined improvement of 1.30 deciviews (0.65 deciviews improvement from Unit 1 and 0.65 deciviews improvement from Unit 2).

The row displaying Model Scenario 1 results depicts the visibility improvement resulting from SO₂ BART and DryFinishing™ (i.e. the difference between Model Scenario 0 and 1). The remaining model scenarios depict the visibility improvements between Model Scenario 1 and the respective model scenario. For example, the Model Scenario 4 results display the visibility change between Model Scenario 1 and Model Scenario 4. Results from Model Scenario 2 through Model Scenario 6 are used to evaluate the potential visibility improvement resulting from the NO_x BART controls evaluated in this BART determination.

Table 12: Combined Unit 1 and 2 98th Percentile Deciview Improvement for Year 2000

^A Displayed for informational purposes, shows impact of SO₂ BART and DryFining™

As is shown for Model Scenario 1 of Table 12 through Table 15, the maximum improvement SO₂ BART in conjunction with DryFinishing™ had on visibility was 1.97 deciviews in year 2001, with an average of 1.50 deciviews of improvement from 2000–2002. Both improvements occurred at Lostwood. The maximum of 1.97 with an average of 1.50 deciviews represents a significant modeled improvement on visibility as a result of SO₂ BART in conjunction with DryFinishing™.

For the reasons outlined earlier in this Section, the Department believes the most accurate information to use when evaluating visibility improvement for the NO_x controls evaluated is shown in Model Scenarios 2 through 4 of Table 12 through Table 15.

Model Scenario 2 displays the deciview improvement from the installation of LNC3+. Average Model Scenario 2 visibility improvements ranged from 0.12 to 0.15 deciviews, with a combined average visibility improvement of 0.13 deciviews. A maximum improvement of 0.23 deciviews was modeled at TRNP South Unit in the year 2002.

Model Scenario 3 displays the deciview improvement from the installation of LNC3+ with SNCR. Average Model Scenario 3 visibility improvements ranged from 0.19 to 0.21 deciviews with a combined average visibility improvement of 0.20 deciviews. A maximum improvement of 0.37 deciviews was modeled at TRNP South Unit in the year 2002.

Model Scenario 4 displays the deciview improvement from the installation of LNC3+ with SCR at the vendor expected 5% SO₂ to SO₃ oxidation rate. Average Model Scenario 4 visibility improvements ranged from -0.02 to 0.14 deciviews with a combined average visibility improvement of 0.09 deciviews.³¹ A maximum improvement of 0.31 deciviews was modeled at TRNP North Unit in the year 2002.

The maximum modeled visibility improvement for all the NO_x controls evaluated comes from the Model Scenario 6, which is the hypothetical 0% SO₂ to SO₃ oxidation rate. Average Model Scenario 6 visibility improvements ranged from 0.28 to 0.33 deciviews with a combined average visibility improvement of 0.30 deciviews. A maximum improvement of 0.55 deciviews was modeled at TRNP South Unit in the year 2002. These results are representative of the expected cumulative visibility improvement from Unit 1 and Unit 2 due to the installation of SCR with an annual performance level of 0.06 lb NO_x per MMBtu and a 0% SO₂ to SO₃ oxidation rate. Even with this conservative methodology, these modeled visibility improvements are minimal.

None of the NO_x BART controls modeled were shown to have a significant impact on improving visibility in North Dakota's Class 1 Areas. Therefore, when determining the appropriate NO_x BART controls, visibility did not contribute significantly to the BART selection.

3.6 Step 6 – Select BART

In consideration of the BART related factors addressed in Section 3.1 through 3.5, the Department has determined the appropriate NO_x BART technology for CCS Units 1 and 2 to be a combination of closed coupled overfired air, separated overfired air, and low-NO_x burners with expanded overfired air registers in conjunction with DryFinishing™. This has been referred to as LNC3+ throughout this

³¹ The -0.02 represents additional modeled impairment to be expected with SCR installation resulting from the additional PM (as sulfuric acid mist).

BART determination. LNC3+ technology is currently installed on Unit 1 and Unit 2 at Coal Creek Station.

The selection of LNC3+ as BART is supported in this BART determination due to the following reasons:

- Cost feasible at \$700 per ton of NO_x reduced while providing a 28% reduction from the baseline emissions rate (See Table 7 and Table 8)
- Has negligible energy and non-air quality environmental impacts (See Section 3.4.2)

The selection of SNCR as BART is not supported in this BART determination due to the following reasons:

- Not cost feasible due to an incremental cost of \$7,800 per ton of NO_x reduced relative to LNC3+, while only providing an additional 17% reduction in NO_x (See Table 7 and Table 8)
- Has potentially significant non-air quality environmental impacts (See Section 3.4.2)
- The highest visibility improvement of LNC3+ w/SNCR (over LNC3+ alone) is 0.07 deciviews.³² This maximum modeled visibility improvement is extremely small and comes at a significant cost, over \$90,000,000 per 1 deciview of improvement.

The selection of SCR as BART is not supported in this BART determination due to the following reasons:

- Technical feasible concerns without undertaking of pilot scale testing (See Section 3.2)
- Not cost feasible considering a minimum incremental cost of \$10,300 per ton of NO_x reduced relative to LNC3+ (See Table 8)
- Not cost feasible with incremental costs ranging from of \$12,200–\$21,600 per ton of NO_x reduced relative to LNC3+ with SNCR (See Table 8).
- Has potentially significant non-air quality environmental impacts (See Section 3.4.2)
- The highest visibility improvement of LNC3+ w/SCR (over LNC3+ alone) is 0.16 deciviews.³³ This maximum modeled visibility improvement is very small and comes at a significant cost, over \$110,000,000 per 1 deciview of improvement. Additionally, for the reasons outlined in Section 3.5 the expected actual visibility improvement will be smaller than presented herein.

Recent performance data for LNC3+ on Unit 2, as outlined in Table 4, indicates a sustained annual average performance rate of approximately 0.13 lb NO_x per MMBtu. This annual average performance rate should not be misconstrued as achievable on a shorter-term basis (e.g. 30-day rolling average). There is inherent variability with shorter-term operations due to unit load swings and variable sodium concentrations in North Dakota lignite coal.^{34,35} To account for this variability, the Department is proposing a BART NO_x emissions limit on Unit 1 and Unit 2 of 0.15 lb NO_x per MMBtu on a 30-day rolling average basis. The 30-day rolling average limits are consistent with the

³² 0.07 deciviews is calculated from (0.37-0.23)/2, see Table 14 Model Scenario 3 and 4 for TRNP South Unit.

³³ 0.16 deciviews is calculated from (0.55-0.23)/2, see Table 14 Model Scenario 3 and 6 for TRNP South Unit.

³⁴ Appendix B.4.b., p. 3 and 34-35. PDF page 583 and 615-615.

³⁵ Appendix B.4.b., Attachment D. PDF page 904-909.

BART guidelines³⁶, and a limit of 0.15 lb NO_x per MMBtu on a 30-day rolling average is achievable in practice. A 5–15% upward adjustment from an annual average to establish a shorter-term limit is consistent with Department and EPA experience.³⁷

The proposed limit of 0.15 lb NO_x per MMBtu on a 30-day rolling average is less than the presumptive BART limit established in Table 1 of the BART guidelines for tangential-fired lignite units. Table 1 of the guidelines indicates a presumptive BART limit of 0.17 lb NO_x per MMBtu on a 30-day rolling average.³⁸

4 Permit to Construct

The emission limits, monitoring, recordkeeping and reporting requirements will be included in a federally enforceable Air Pollution Control Permit to Construct that will be issued to the owner/operator of the facility. Monitoring for NO_x will be accomplished by using the continuous emission monitors required by 40 CFR 75 for the Acid Rain Program. The owner/operator will be required to conduct recordkeeping and reporting as required by NDAC 33.1-15-14-06, Title V Permit to Operate and NDAC 33.1-15-21, Acid Rain Program (40 CFR 72, 75 and 76).

Permit to Construct No. PTC21001 is included in Appendix F.2.

F.2 – Coal Creek Station NOx BART Permit to Construct

**AIR POLLUTION CONTROL
PERMIT TO CONSTRUCT**

Pursuant to the Air Pollution Control Rules of the State of North Dakota (North Dakota Administrative Code Article 33.1-15, Chapter 33.1-15-14 and Chapter 33.1-15-25), the North Dakota Department of Environmental Quality hereby issues a Permit to Construct for the following source:

I. General Information:

A. **Permit to Construct Number:** PTC21001

B. **Source:**

1. **Name:** Coal Creek Station
2. **Location:** 2875 Third Street SW
Underwood, ND 58576-9596
3. **Source Type:** Fossil-fuel fired steam electric plant (EGU) with a nominal generating capacity of over 1,200 megawatts
4. **Equipment at the Facility Subject to NO_x BART:**

Unit 1 - Coal-fired boiler (nominal 6,015 x 10⁶ Btu/hour heat input)

Unit 2 - Coal-fired boiler (nominal 6,022 x 10⁶ Btu/hour heat input)

C. **Owner/Operator:**

1. **Name:** Rainbow Energy Center
2. **Address:** 919 Seventh Street, Suite 405
Bismarck, ND 58504

II. Permit Conditions:

The Permit to Construct only establishes the emission limits and other requirements if, and when, EPA approves those limits as part of the Regional Haze SIP. The source shall be operated in accordance with the terms of this Permit to Construct and the Title V Permit to Operate until a revised Title V Permit to Operate is issued. The source is subject to all applicable rules, regulations, and orders now or hereafter in effect of the North Dakota Department of Environmental Quality and to the conditions specified below:

4201 Normandy St | Bismarck ND 58503-1324 | Fax 701-328-5200 | deq.nd.gov

Director's Office
701-328-5150

Division of
Air Quality
701-328-5188

Division of
Municipal Facilities
701-328-5211

Division of
Waste Management
701-328-5166

Division of
Water Quality
701-328-5210

Division of Chemistry
701-328-6140
2635 East Main Ave
Bismarck ND 58501

A. **Special Conditions:**

1. **Definitions:** Terms not defined below shall have the meaning given them in the Clean Air Act or EPA's regulations implementing the Clean Air Act. For purposes of this permit:
 - a. *Boiler operating day* means a 24-hour period between 12 midnight and the following midnight during which any fuel is combusted at any time in the EGU. It is not necessary for fuel to be combusted for the entire 24-hour period.
 - b. *Continuous emission monitoring system or CEMS* means the equipment required by this permit to sample, analyze, measure and provide, by means of readings recorded at least once every 15 minutes (using an automated data acquisition and handling system (DAHS)), a permanent record of NO_x emissions, other pollutant emissions, diluent or stack gas volumetric flow rate.
 - c. *NO_x* means nitrogen oxides.
 - d. *Unit* means any of the EGU's identified in section I.B.
 - e. *30-day rolling average*, as used in this permit, shall be determined by calculating an arithmetic average of all hourly rates for the current boiler operating day and the previous 29 boiler operating days. A new 30-day rolling average shall be calculated for each boiler operating day. Each 30-day rolling average rate shall include start-up, shutdown, emergency and malfunction periods unless those periods are exempt by this permit. The 30-day rolling average emission rate is calculated as follows:
 - Calculate the hourly average emission rate for any hour in which any fuel is combusted in the boiler.
 - Calculate the 30-day rolling average emission rate as the arithmetic average of all valid hourly average emission rates for the 30 successive boiler operating days.
2. **Emission Limits:** Coal Creek Station Unit 1 and Unit 2 shall not emit or cause to be emitted NO_x in excess of 0.15 pounds per million British Thermal Units (0.15 lb/10⁶ Btu) averaged over a 30-day period (30-day rolling average). The emission limit applies to both units at all times including startup, shutdown, emergency and malfunction.

3. **Compliance Date:** Compliance with the emission limits and other requirements of this permit is required when the U.S. Environmental Protection Agency approves this permit as a part of the Regional Haze SIP.
4. **Continuous Emission Monitoring (CEM):** The emissions from each unit shall each be measured by continuous emission monitors (CEM) for NO_x, CO₂ and flow. The monitoring requirements under Condition II.A.5 shall be the compliance determination method for NO_x.
5. **Monitoring Requirements and Conditions:**
 - a. Compliance determination: At all times Coal Creek Station shall maintain, calibrate, and operate a CEMS, in full compliance with the requirements found at 40 CFR Part 75, to accurately measure NO_x, diluent and stack gas volumetric flow rate from each unit. The CEMS shall be used to determine compliance with the emission limits in Section II.A.2.
 - b. Methods:
 1. For any hour in which fuel is combusted in a unit, Coal Creek Station shall calculate the hourly average NO_x concentration in lb/MMBtu at the CEMS in accordance with the requirements of 40 CFR Part 75. At the end of each boiler operating day, the owner/operator shall calculate and record a new 30-day rolling average emission rate in lb/MMBtu from the arithmetic average of all valid hourly emission rates from the CEMS for the current boiler operating day and the previous 29 successive boiler operating days.
 2. An hourly average NO_x emission rate in lb/MMBtu is valid only if the minimum number of data points, as specified in 40 CFR Part 75, is acquired by both the NO_x pollutant concentration monitor and the diluent monitor (O₂ or CO₂).
 3. Data reported to meet the requirements of this section shall not include data substituted using the missing data substitution procedures of Subpart D of 40 CFR Part 75, nor shall the data have been bias adjusted according to the procedures of 40 CFR Part 75.
 4. The Department may require additional performance audits of the CEM systems.

5. Coal Creek Station shall maintain and operate air pollution control monitoring equipment in a manner consistent with the manufacturer's recommended Operations and Maintenance (O&M) procedures, or a site-specific O&M procedure (developed from the manufacturer's recommended O&M procedures). Coal Creek Station shall have the O&M procedures available on-site and provide the Department with a copy when requested.

5. **Recordkeeping Requirements:**

Coal Creek Station shall maintain the following records for at least five years:

- a. All CEMS data, including the date, place and time of sampling or measurement; parameters sampled or measured and results.
- b. Records of quality assurance and quality control activities for emissions measuring systems including, but not limited to, any records required by 40 CFR Part 75.
- c. Records of all major maintenance activities conducted on emission units, air pollution control equipment and CEMS.
- d. Any other records required by 40 CFR Part 75.

6. **Reporting:**

- a. Coal Creek Station shall submit quarterly excess emissions reports no later than the 30th day following the end of each calendar quarter. Excess emissions means emissions that exceed the emissions limits specified in Section II.A.2. The reports shall include the magnitude, date(s) and duration of each period of excess emissions, specific identification of each period of excess emissions that occurs during startups, shutdown and malfunctions of the unit, the nature and cause of any malfunction (if known) and corrective action taken or preventative measures adopted.
- b. Coal Creek Station shall submit quarterly CEMS performance reports, to include dates and duration of each period during which the CEMS was inoperative (except for zero and span adjustments and calibration checks), reason(s) why the CEMS was inoperative and steps taken to prevent recurrence, any CEMS repairs or

adjustments and results of any CEMS performance tests required by 40 CFR Part 75 (Relative Accuracy Test Audits, Relative Accuracy Audits and Cylinder Gas Audits).

- c. When no excess emissions have occurred or the CEMS has not been inoperative, repaired or adjusted during the reporting period, such information shall be stated in the report.
- d. Coal Creek Station shall submit a semi-annual report for all monitoring records required under Condition II.A.5 on forms supplied or approved by the Department. All instances of deviations from the permit must be identified in the report. A monitoring report shall be submitted within 45 days after June 30 and December 31 of each year.
- e. Coal Creek Station shall submit an annual compliance certification report within 45 days after December 31 of each year on forms supplied or approved by the Department.
- f. Coal Creek Station shall submit an annual emission inventory report on forms supplied or approved by the Department. This report shall be submitted by March 15 of each calendar year. Insignificant units/activities listed in this permit do not need to be included in the annual emission inventory report.

B. General Conditions:

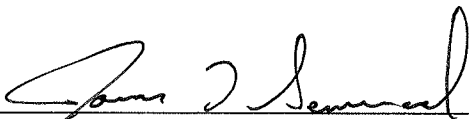

- 1. Nothing in this section shall preclude the use, including the exclusive use, of any credible evidence or information, relevant to whether a source would have been in compliance with requirements of this section if the appropriate performance or compliance test procedures or method had been performed.
- 2. This permit shall in no way permit or authorize the maintenance of a public nuisance or danger to public health or safety.
- 3. Coal Creek Station shall comply with all State and Federal environmental laws and rules. In addition, Coal Creek Station shall comply with all local building, fire, zoning, and other applicable ordinances, codes, rules and regulations.
- 4. Coal Creek Station shall at all times, including periods of startup, shutdown, and malfunction, maintain and operate Unit 1 and Unit 2 and all other emission units including associated air pollution equipment and

fugitive dust suppression operations in a manner consistent with good air pollution control practices for minimizing emissions.

5. Any duly authorized officer, employee or agent of the North Dakota Department of Environmental Quality may enter and inspect any property, premise or place at which the source listed in Item I.B. of this permit is or will be located at any time for the purpose of ascertaining the state of compliance with the North Dakota Air Pollution Control Rules and the conditions of this permit.
6. Any violation of a condition issued as part of this approval to construct is regarded as a violation of construction authority and is subject to enforcement action.
7. The conditions of this permit herein are effective only upon final approval by the Environmental Protection Agency. If federal laws, a federal court, or a final federal agency action renders any control measures included in the permit unenforceable by the Environmental Protection Agency, the requirement to implement the measures may not be enforced under state law to the same extent the measures are unenforceable under federal law, under the North Dakota Air Pollution Control Law, NDCC § 23.1-06-16.

Bismarck, ND 58501-1947

RE: Coal Creek Station BART for NO_x Emissions – Visibility Impairment Modeling Results for
Additional SCR SO₂ Oxidation Scenarios

Dear Mr. Stroh:

Pursuant to recent conversations with you and Great River Energy (GRE) staff, GRE understands that the US EPA Region 8 and federal land managers provided feedback to you on the September 2019 NO_x BART report concerning the estimated degree of sulfur dioxide (SO₂) oxidation resulting from the selective catalytic reduction (SCR) technology control scenario. This letter provides additional technical information regarding SO₂ oxidation resulting from the SCR control scenario at Coal Creek Station. Additionally, Barr Engineering Co. (Barr) has prepared supplemental dispersion modeling analyses of visibility impacts for the SCR control scenario at different levels of SCR-related SO₂ oxidation for informational purposes.

The September 2019 NO_x BART report included technical documents from Barr and from Black and Veatch as well as expert information provided by other third parties. Both of the engineering consulting firms concluded that low-dust SCR as a retrofit technology at Coal Creek Station has considerable technical challenges, is not cost-effective, and would result in additional energy impacts and combustion impacts from its use.¹ Notwithstanding these conclusions pursuant to the first four BART factors, modeling analyses relevant to the fifth BART factor of evaluating visibility impacts were also conducted. As the two engineering consulting firms disagreed on the demonstrable and sustained NO_x performance level for SCR at Coal Creek Station, two SCR emissions scenarios – Scenario #4A at 0.04 lb/MMBtu and Scenario #4B at 0.06 lb/MMBtu – were modeled for the change in visibility impairment.

Inputs to the visibility impacts analysis include emission rates of SO₂, NO_x, and PM₁₀ with its speciated components of coarse particulate, fine particulate, secondary organic aerosols, elemental carbon, and sulfate (SO₄). This last modeled component of sulfate is affected by application of SCR technology due to oxidation of SO₂ to SO₃, which is a precursor of sulfuric acid mist (SAM or H₂SO₄).

¹ High-dust SCR technology was also evaluated by these firms and was deemed technically and economically infeasible as a retrofit technology at Coal Creek Station.

The SO₂ oxidation rate due to SCR used by Barr in the modeling analysis is 5%. This oxidation rate comes from IBIDEN Ceram, an SCR catalyst vendor. It was determined by IBIDEN Ceram to be most appropriate design value based on their examination of site-specific characteristics at Coal Creek Station and with respect to their considerable experience with SCR catalysts.²

As follow-up to our conversations in January 2020, GRE reached out again to IBIDEN Ceram for additional technical information regarding the 5% SO₂ oxidation rate. They provided the illustration below, noting that catalyst design temperature for the GRE project is 830° F and the SO₂ to SO₃ oxidation rate is a large function of temperature. At baseload operation the flue gas exiting the economizer fluctuates between 800° and 830° F which is dependent upon coal quality and soot blowing. IBIDEN Ceram also stated that they are experienced with SCR systems that operate at elevated temperatures and that oxidation rate is exponential to temperature, regardless of fuel type.

Notwithstanding IBIDEN Ceram’s analysis and since North Dakota lignite fueled units do not operate with SCR technology, there is no empirical data specific to these installations at a utility scale that can definitively conclude the SO₂ oxidation rate due to SCR at Coal Creek Station. Additionally, Electric Power Research Institute (EPRI) describes several additional variables that impact the rate of SCR-related SO₂ oxidation (i.e., fuel sulfur content, fly ash alkalinity, catalyst material and volume) as well as related measurement uncertainties between laboratory tests and field trials.³ Because of these

² See the September 2019 NO_x BART analysis at Attachment 1, Appendix E, for IBIDEN Ceram’s analysis and their reference list of SCR projects.

³ EPRI’s report, “Estimating Total Sulfuric Acid Emissions from Stationary Power Plants,” March 2018, is found in Attachment H-1 of the September 2019 NO_x BART report.

considerations, Barr has calculated the sulfuric acid mist generated by SCR at an SO₂ oxidation rate of 0% and 2.5% in addition to the 5% level used in the September 2019 report.

The 0% rate is hypothetical only and is not technically supportable, but it is provided for informational purposes to assess the theoretical visibility impairment level if no additional sulfuric acid mist was created due to SCR. The corresponding PM₁₀ emissions rate for this scenario is the same as that used in Emissions Control Scenarios #1 through #3 of 90.2 lb/hr for Unit 1 and 90.3 lb/hr for Unit 2.

The 2.5% rate is chosen as a mid-point between 0% and 5%, which is representative of the range provided in EPRI's report based on other types of coals but does not recognize the specific fuel and operational considerations at Coal Creek Station in IBIDEN Ceram's analysis. Correspondingly, the 2.5% rate is used in the modeling analysis to assess the theoretical visibility impairment level at a reduced level of sulfuric acid mist formation due to SCR compared to that at 5% oxidation. The resulting generation of sulfuric acid mist at 2.5% oxidation is 51 lb/hr, compared to the 109 lb/hr generated at 5% oxidation. The corresponding PM₁₀ emissions rate for this scenario is the same as that used in Emissions Control Scenarios #1 through #3 of 141.2 lb/hr for Unit 1 and 141.3 lb/hr for Unit 2.

The 0% and 2.5% oxidation rates are incorporated into individual modeling runs for Emissions Control Scenarios #4A and #4B. In summary, the results of these model sensitivity runs do not appreciably change the visibility impairment at the Class I areas, being on the order of ~0.1 delta-deciview per unit improvement.

Several tables have been updated to reflect the additional 0% and 2.5% oxidation rates for Scenarios #4A and #4B. These tables are identified and numbered in the same manner as that presented in Greg Archer's email to you on November 1, 2019.

The first sets of tables entail modeling the control options for one unit while holding the other unit at the facility at a fixed emission rate so that total facility emissions are accounted for in the model chemistry. Two potential configurations are evaluated – one holding the non-evaluated unit at Scenario 1 rates (LNC3, DryFining™, SO₂ BART – **Tables 1 to 6**), and the other holding the non-evaluated unit at Scenario 2 rates (LNC3+, DryFining™, SO₂ BART – **Tables 7 to 12**).

Modified versions of Tables 3-5 through 3-7 from the BART report are also included as **Tables 3-5a through 3-7a**, with the columns for modeled days over 1.0 and 0.5 deciviews replaced by net improvement in visibility versus Scenario 1 emissions. This provides a common basis for comparing emission controls between all tables.

Alternatively, attached is another version of tables 7 to 12 (tagged as **Tables 7a to 12a**) which calculates the net improvement versus Scenario 2 rather than versus Scenario 1. This provides a clearer comparison of control effectiveness versus LNC3+ emissions, and this approach also aligns with the expected emissions as of mid-2020 for evaluating additional controls.

Notably, the deciviews are negative in instances where SCR at the 5% oxidation rate has more of an impact as compared to Scenario 3, with SNCR. This is understandably a function of the increase in PM.

Much like SCR 0.04 and 0.06 sensitivity (Scenarios #4A and #4B, respectively), which did not materially change the conclusions, the oxidation rate sensitivity also does not materially change the conclusions.

Please contact Deb Nelson at 763-445-5208 if you have any questions regarding the four-factor analysis or wish to discuss any of the above.

Sincerely,

GREAT RIVER ENERGY

Appendix G – Attorney General Opinion

ATTORNEY GENERAL'S OPINION
Statement of Authority

**State Plan for Implementing
40 C.F.R. § 51.308, Regional Haze Program Requirements**

At the request of the North Dakota Department of Environmental Quality (Department), I have reviewed the relevant elements of the Regional Haze State Implementation Plan (SIP) submitted by the Department to the Environmental Protection Agency (EPA) for approval in accordance with Section 110 of the Clean Air Act. As discussed in more detail below, it is my opinion that North Dakota law currently provides adequate authority for the Department to adopt and implement the Regional Haze SIP, including the Permit to Construct issued as part of the SIP. This opinion includes a review of the statutes, rules, and other legal authority for the SIP. Attached to this opinion are the relevant sections of North Dakota law.

I. Authority to Adopt the SIP

North Dakota's legislature has designated the Department as the agency to "develop and coordinate a statewide program of air pollution control." N.D.C.C. § 23.1-06-04(1). The Department has the authority to cooperate with EPA and to "develop, implement, and enforce" federal air pollution prevention and control programs. N.D.C.C. § 23.1-06-04(1)(l). And, the Department is specifically directed to "develop and implement a state regional haze plan" N.D.C.C. § 23.1-06-16(1).

To implement and enforce federal programs, the Department may adopt rules, including rules setting ambient standards and emission limitations. N.D.C.C. § 23.1-06-04(1)(h), (l). The Department properly adopted rules implementing the Regional Haze Requirements. See N.D. Admin. Code ch. 33.1-15-25.

A person must obtain a permit from the Department to "construct, install, modify, use, or operate an air contaminant source" N.D.C.C. § 23.1-06-09. The Department may impose requirements on the issuance of such permits. See N.D. Admin. Code ch. 33.1-15-14.

Accordingly, the Department has the authority to adopt the Regional Haze SIP, including the Permit to Construct issued as part of the SIP.

II. Authority to Implement the SIP

The Department also has the legal authority to carry out the Regional Haze SIP, as required by 40 C.F.R. § 51.230. Specifically, the Department has the authority to:

- Adopt emission standards and limitations and any other measures necessary for attainment and maintenance of national standards: N.D.C.C. § 23.1-06-04(1)(h), (l).
- Enforce applicable laws, regulations, and standards, and seek injunctive relief: N.D.C.C. §§ 23.1-06-04(1)(e), (i), 23.1-06-14.
- Abate pollutant emissions on an emergency basis to prevent substantial endangerment to the health of persons: N.D.C.C. §§ 23.1-06-04(1)(e), 23.1-06-13, 23.1-06-14(5).
- Prevent construction, modification, or operation of a facility, building, structure, or installation, or combination thereof, which directly or indirectly results or may result in emissions of any air pollutant at any location which will prevent the attainment or maintenance of a national standard: N.D.C.C. §§ 23.1-06-04(1)(e), (f), 23.1-06-09, 23.1-06-14(5); N.D. Admin. Code §§ 33.1-15-14-02, 33.1-15-14-06; N.D. Admin. Code ch. 33.1-15-25.
- Obtain information necessary to determine whether air pollution sources are in compliance with applicable laws, regulations, and standards, including authority to require recordkeeping and to make inspections and conduct tests of air pollution sources: N.D.C.C. §§ 23.1-06-04(1)(j), 23.1-06-09, 23.1-06-11; N.D. Admin. Code §§ 33.1-15-14-02(9), 33.1-15-14-06(4), (5), 33.1-15-25-04.
- Require owners or operators of stationary sources to install, maintain, and use emission monitoring devices and to make periodic reports to the State on the nature and amounts of emissions from such stationary sources; also authority for the State to make such data available to the public as reported and as correlated with any applicable emission standards or limitations: N.D.C.C. §§ 23.1-06-04(1)(j), 23.1-06-09; N.D. Admin. Code §§ 33.1-15-01-16, 33.1-15-14-02(9), 33.1-15-14-06(5), 33.1-15-25-04.

III. The Department Complied with State Law Procedural Requirements in Issuing the Permit to Construct

In addition to the above, I have reviewed the Department's Public Hearing Notice and other relevant information. Based on this review, it is my opinion that the Permits to

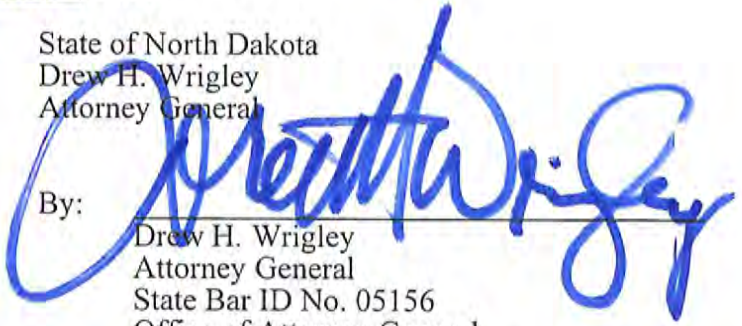

Construct were issued in compliance with state procedural requirements. See N.D.C.C.

§ 23.1-01-07; N.D. Admin. Code § 33.1-15-14-02(6).

Dated this 8th day of August, 2022.

State of North Dakota
Drew H. Wrigley

Relevant Sections of the North Dakota Century Code

23.1-01-07. Permit or investigatory hearings - Exemption from chapters 28-32 and 54-57.

A permit hearing conducted for purposes of receiving public comment or an investigatory hearing conducted under chapters 23.1-03, 23.1-04, 23.1-06, 23.1-08, 61-28, and 61-28.1 is not an adjudicative proceeding under chapter 28-32 and is not subject to the requirements of chapter 54-57.

23.1-06-04. Power and duties of the department.

1. The department shall develop and coordinate a statewide program of air pollution control. To accomplish this, the department shall:
 - a. Encourage the voluntary cooperation of persons to achieve the purposes of this chapter.
 - b. Determine by scientifically oriented field studies and sampling the degree of air pollution in the state and the several parts thereof.
 - c. Encourage and conduct studies, investigations, and research relating to air pollution and its causes, effects, prevention, abatement, and control.
 - d. Advise, consult, and cooperate with other public agencies and with affected groups and industries.
 - e. Issue orders necessary to effectuate the purposes of this chapter and enforce the orders by all appropriate administrative and judicial procedures.
 - f. Provide rules relating to the construction of any new direct or indirect air contaminant source or modification of any existing direct or indirect air contaminant source which the department determines will prevent the attainment or maintenance of any ambient air quality standard, and require that before commencing construction or modification of any such source, the owner or operator shall submit the information necessary to permit the department to make this determination.
 - g. Establish ambient air quality standards for the state which may vary according to appropriate areas.
 - h. Formulate and adopt emission control requirements for the prevention, abatement, and control of air pollution in this state including achievement of ambient air quality standards.
 - i. Hold hearings relating to the administration of this chapter, and compel the attendance of witnesses and the production of evidence.
 - j. Require the owner or operator of a regulated air contaminant source to establish and maintain records; make reports; install, use, and maintain monitoring equipment or methods; sample emissions in accordance with those methods at designated locations and intervals, and using designated procedures; and provide other information as may be required.
 - k. Provide by rules a procedure for handling applications for a variance for any person that owns or is in control of any plant, establishment, process, or equipment. The granting of a variance is not a right of the applicant but must be in the discretion of the department.
 - l. Provide by rules any procedures necessary and appropriate to develop, implement, and enforce any air pollution prevention and control program established by the federal Clean Air Act [42 U.S.C. 7401 et seq.], as amended, the authorities and responsibilities of which are delegatable to the state by the United States environmental protection agency. The rules may include enforceable ambient standards, emission limitations, and other control measures, means, techniques, or economic incentives, including fees, marketable permits, and auctions of emissions rights, as provided by the Act. The department shall develop and implement the federal programs if the department determines that doing so benefits the state.
 - m. Provide by rules a program for implementing lead-based paint remediation training, certification, and performance requirements in accordance with title 40, Code of Federal Regulations, part 745, sections 220, 223, 225, 226, 227, and 233.
2. After consultation with the advisory council, the department may adopt, amend, and repeal rules under this chapter.

23.1-06-09. Permits or registration.

1. A person may not construct, install, modify, use, or operate an air contaminant source designated by regulation, capable of causing or contributing to air pollution, either directly or indirectly, without a permit from the department or in violation of any conditions imposed by the permit.
2. The department shall provide for the issuance, suspension, revocation, and renewal of permits that it requires under this section.
3. The department may require applications for permits to be accompanied by plans, specifications, and other information it deems necessary.
4. Possession of an approved permit or registration certificate does not relieve any person of the responsibility to comply with applicable emission limitations or with any other law or rule, and does not relieve any person from the requirement to possess a valid contractor's license issued under chapter 43-07.
5. The department by rule may provide for registration and registration renewal of certain air contaminant sources in lieu of a permit.
6. The department may exempt by rule certain air contaminant sources from the permit or registration requirements in this section when the department makes a finding the exemption will not be contrary to section 23.1-06-02.

23.1-06-11. Right of onsite inspection.

1. Any duly authorized officer, employee, or agent of the department may enter and inspect any property, premise, or place on or at which an air contaminant source is located or is being constructed, installed, or established at any reasonable time for the purpose of ascertaining the state of compliance with this chapter and related rules. If requested, the owner or operator of the premises must receive a report setting forth all facts found which relate to compliance status.
2. The department may conduct tests and take samples of air contaminants, fuel, process material, and other materials that may affect emission of air contaminants from any source, and may have access to and copy any records required by department rules to be maintained, and may inspect monitoring equipment located on the premises. Upon request of the department, the person responsible for the source to be tested shall provide necessary holes in stacks or ducts and other safe and proper sampling, and testing facilities exclusive of instruments and sensing devices necessary for proper determination of the emission of air contaminants. If an authorized representative of the department, during the course of an inspection, obtains a sample of air contaminant, fuel, process material, or other material, the representative shall issue a receipt for the sample obtained to the owner or operator of, or person responsible for, the source tested.
3. To ascertain the state of compliance with this chapter and any applicable rules, a duly authorized officer, employee, or agent of the department may enter and inspect, at any reasonable time, any property, premises, or place on or at which a lead-based paint remediation activity is ongoing. If requested, the department shall provide to the owner or operator of the premises a report that sets forth all facts found which relate to compliance status.

23.1-06-13. Administrative procedure and judicial review.

Any proceeding under this chapter for the issuance or modification of rules and regulations, including emergency orders relating to control of air pollution, or determining compliance with rules and regulations of the department, must be conducted in accordance with chapter 28-32. Appeals from the proceeding may be taken under chapter 28-32. When an emergency exists requiring immediate action to protect the public health and safety, the department may, without notice or hearing, issue an order reciting the existence of the emergency and requiring action be taken as necessary to meet the emergency. Notwithstanding any provision of this chapter, the order must be effective immediately, but on application to the department an interested person must be afforded a hearing before the environmental review advisory council within ten days. On the basis of the hearing, the emergency order must be continued, modified, or revoked within thirty days after the hearing. Except as provided for in this section, notice of any hearing held under this chapter must be issued at least thirty days before the date specified for the hearing.

23.1-06-14. Enforcement - Penalties - Injunctions.

1. A person that willfully violates this chapter, or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter, is subject to a fine of not more than ten thousand dollars per day per violation, or by imprisonment for not more than one year, or both. If the conviction is for a violation committed after a first conviction of the person under this subsection, punishment must be a fine of not more than twenty thousand dollars per day per violation, or by imprisonment for not more than two years, or both.
2. A person that violates this chapter, or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter, with criminal negligence, is subject to a fine of not more than ten thousand dollars per day per violation, or by imprisonment for not more than six months, or both.
3. A person that knowingly makes any false statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under this chapter or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter, or that falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this chapter or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter, upon conviction, is subject to a fine of not more than ten thousand dollars per day per violation, or by imprisonment for not more than six months, or both.
4. A person that violates this chapter, or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter, is subject to a civil penalty not to exceed ten thousand dollars per day per violation.
5. Without prior revocation of any pertinent permits, the department, in accordance with the laws of this state governing injunction or other process, may maintain an action in the name of the state against any person to enjoin a threatened or continuing violation of any provision of this chapter or any permit condition, rule, order, limitation, or other applicable requirement implementing this chapter.

23.1-06-16. Implementation of federal regional haze program requirements.

1. Consistent with the federal Clean Air Act [42 U.S.C. 7401 et seq.] and the regulations adopted under the Clean Air Act, the department shall develop and implement a state regional haze plan in accordance with this section.
2. The state regional haze plan must include an analysis of the natural and international causes of visibility impairment.
3. In developing a periodic comprehensive revision of the state implementation plan, the department shall consider whether additional measures are necessary to make reasonable progress toward meeting the national goal of visibility improvement, as required by the federal Clean Air Act [42 U.S.C. 7401 et seq.] and further defined by the United States environmental protection agency to be natural visibility conditions by 2064. The department may not require controls the department has determined serve only to increase total costs with little corresponding visibility benefit.
4. If the environmental protection agency disapproves the state regional haze plan, the department may develop and submit as expeditiously as possible a revised plan to address the reasons for the disapproval in accordance with the requirements of this section.
5. Any new control measures mandated by the state regional haze plan are effective only upon final approval by the environmental protection agency.
6. If federal laws, a federal court, or a final federal agency action renders any control measures included in the state plan unenforceable by the environmental protection agency, the requirement to implement the measures may not be enforced under state law to the same extent the measures are unenforceable under federal law.

Relevant Sections of the
North Dakota Administrative Code

33.1-15-01-16. Confidentiality of records.

1. **Public inspection.** Any record, report, or information obtained or submitted pursuant to this article will be available to the public for inspection and copying during normal working hours unless the department certifies that the information is confidential. Anyone requesting department assistance in collecting, copying, certifying, or mailing public information must tender, in advance, the reasonable cost of those services.
2. **Information submitted as trade secrets.** The department may certify records, reports, or information, or particular part thereof, other than emission data, as confidential upon a showing that the information would, if made public, divulge methods or processes entitled to protection as trade secrets. Any person submitting trade secret information must present the information to the department in a sealed envelope marked "CONFIDENTIAL". Each page of any document claimed confidential must be clearly marked with the word "CONFIDENTIAL". The submission must contain two parts:
 - a. The material claimed to contain trade secret information; and
 - b. A request for confidential treatment including:
 - (1) All information for which no claim is being made;
 - (2) An affidavit stating how and why the information fulfills the conditions of confidentiality under this subsection; and
 - (3) An index to and summary of the information submitted which is suitable for release to the public.
3. **Accepted trade secret claims.** All information which meets the test of subsection 2 must be marked by the department as "ACCEPTED" and protected as confidential information.
4. **Rejected trade secret claims.** If the department determines that information submitted pursuant to subsection 2 does not meet the criteria of that subsection for confidential treatment, the department shall promptly notify the person submitting the information of that determination. The department shall in that event give that person at least twenty days in which to:
 - a. Accept the determination of the department;
 - b. Request that the information be returned to the person;
 - c. Further justify the contention that the information deserves protection as a trade secret; or
 - d. Further limit the scope of information for which a claim of confidentiality is made.

If the person who submitted the information fails within the time period allowed by the department to demonstrate satisfactorily to the department that the information in the form presented qualifies for confidential treatment, the department shall promptly notify that person of that determination. If the person submitting the information did not request that it be returned, the department shall mark the information "REJECTED" and treat it as public information. The department's action on a reconsideration constitutes final agency action for purposes of judicial review. Appeal of this action must be to an appropriate district court.
5. **Appeal of nondisclosure claims.** Any person who identifies and tenders the reasonable cost of collecting, copying, certifying, and mailing particular information held by the department under subsection 2 may file with the department a petition for reconsideration stating how and why the public's interest would be better served by the release of the requested information than by its retention as confidential by the department. The department shall then reconsider the confidential status of the information. The department action on a petition for reconsideration constitutes final agency action for purposes of judicial review. Appeal of the department's action must be to an appropriate district court.

6. **Retention of confidential information.** All information which is accepted by the department as confidential must be stored in locked filing cabinets. Only those personnel of the department specifically designated by the department shall have access to the information contained therein. The department may not designate any person to have access to confidential information unless that person requires such access in order to carry out that person's responsibilities and duties. No person may disclose any confidential information except in accordance with the provisions of this section. No copies may be made except as strictly necessary for internal department use or as specified in subsection 8.
7. **Maintenance of log.** Persons designated by the department to maintain confidential files as herein provided shall maintain a log showing the persons who have had access to the confidential files and the date of such access.
8. **Transmittals of confidential information.** As necessary, confidential information acquired by the department under the provisions of the act, or this article, may be transmitted to such federal, state, or local agencies, when necessary for purposes of administration of any federal, state, or local air pollution control laws, which make an adequate showing of need to the department, provided that such transmittal is made under a continuing assurance of confidentiality.
9. **Relationship to issuance of permits.** The department may not process any application for a permit to construct or operate pursuant to chapter 33.1-15-14 or 33.1-15-15 until final agency action on confidential trade secret claims has been completed.

33.1-15-14-05	[Reserved]
33.1-15-14-06	Title V Permit to Operate
33.1-15-14-07	Source Exclusions From Title V Permit to Operate Requirements

33.1-15-14-01. Designated air contaminant sources.

Pursuant to subsection 1 of North Dakota Century Code section 23.1-06-08, stationary sources within the following source categories are designated as air contaminant sources capable of causing or contributing to air pollution, either directly or indirectly.

1. The following chemical process facilities:
 - a. Adipic acid.
 - b. Ammonia.
 - c. Ammonium nitrate.
 - d. Carbon black.
 - e. Charcoal.
 - f. Chlorine.
 - g. Chlor-alkali manufacturing.
 - h. Detergent and soap.
 - i. Explosives (trinitrotoluene and nitrocellulose).
 - j. Hydrochloric acid.
 - k. Hydrofluoric acid.
 - l. Nitric acid.
 - m. Paint and varnish manufacturing.
 - n. Phosphoric acid.
 - o. Phthalic anhydride.
 - p. Plastics manufacturing.
 - q. Printing ink manufacturing.
 - r. Sodium carbonate.
 - s. Sulfur production and recovery.

- t. Sulfuric acid.
 - u. Synthetic fibers.
 - v. Synthetic rubber.
 - w. Terephthalic acid.
 - x. Alcohol.
 - y. Cresylic acids.
 - z. Phenol.
 - aa. Polymer manufacturing and coating operations.
2. The following food and agricultural facilities:
- a. Agricultural drying and dehydrating operations.
 - b. Ammonium nitrate.
 - c. Cheese whey drying and processing.
 - d. Coffee roasting.
 - e. Cotton ginning.
 - f. Feed, grain, and seed handling and processing.
 - g. Fermentation processes.
 - h. Fertilizers.
 - i. Fishmeal processing.
 - j. Meat smokehouses.
 - k. Orchard heaters.
 - l. Potato processing.
 - m. Rendering plants.
 - n. Starch manufacturing.
 - o. Sugarbeet processing.
3. The following metallurgical facilities:
- a. Primary metals facilities:
 - (1) Aluminum ore reduction.
 - (2) Copper smelters.
 - (3) Ferroalloy production.
 - (4) Iron and steel mills.
 - (5) Lead smelters.

- (6) Metallurgical coke manufacturing.
- (7) Zinc.
- b. Secondary metals facilities:
 - (1) Aluminum operations.
 - (2) Brass and bronze smelting.
 - (3) Ferroalloys.
 - (4) Ferrous foundries.
 - (5) Gray iron foundries.
 - (6) Lead smelting.
 - (7) Magnesium smelting.
 - (8) Nonferrous foundries.
 - (9) Steel foundries.
 - (10) Zinc processes.
- c. Electrolytic plating operations.
- 4. The following mineral products facilities:
 - a. Asphalt roofing.
 - b. Asphaltic concrete plants.
 - c. Bricks and related clay refractories.
 - d. Calcium carbide.
 - e. Ceramic and clay processes.
 - f. Clay and fly ash sintering.
 - g. Coal cleaning.
 - h. Coal drying.
 - i. Coal mining.
 - j. Coal handling and processing.
 - k. Concrete batching.
 - l. Fiberglass manufacturing.
 - m. Frit manufacturing.
 - n. Glass manufacturing.
 - o. Gypsum manufacturing.
 - p. Leonardite mining, drying, and processing.

- q. Lime manufacturing.
 - r. Mineral wool manufacturing.
 - s. Paperboard manufacturing.
 - t. Perlite manufacturing.
 - u. Phosphate rock preparation.
 - v. Portland cement manufacturing, bulk handling, and storage.
 - w. Rock, stone, gravel, and sand quarrying and processing.
 - x. Uranium mining, milling, and enrichment.
 - y. Calciners and dryers.
5. The following energy and fuel facilities:
- a. Coal gasification.
 - b. Coal liquefaction.
 - c. Crude oil and natural gas production.
 - d. Fossil fuel steam electric plants.
 - e. Fuel conversion plants.
 - f. Natural gas processing.
 - g. Petroleum refining and petrochemical operations.
 - h. Petroleum storage (storage tanks and bulk terminals).
6. The following wood processing facilities:
- a. Plywood veneer and layout operations.
 - b. Pulpboard manufacturing.
 - c. Wood pulping.
 - d. Sawmills.
 - e. Wood products manufacturing.
7. The following waste management units or facilities:
- a. Afterburners.
 - b. Automobile body incinerators.
 - c. Conical burners.
 - d. Flares.
 - e. Gaseous and liquid organic compounds incinerators.
 - f. Industrial waste incinerators.

- g. Open burning.
 - h. Open pit incinerators.
 - i. Infectious waste incinerators.
 - j. Refuse incinerators.
 - k. Salvage incinerators.
 - l. Sewage sludge incinerators.
 - m. Wood waste incinerators.
 - n. Municipal waste combustors.
8. The following miscellaneous facilities:
 - a. Drycleaning and laundry operations.
 - b. Fuel burning equipment.
 - c. Internal combustion engines.
 - d. Surface coating operations.
 - e. Wastewater treatment plants.
 - f. Water cooling towers and water cooling ponds.
 - g. Stationary gas turbines.
 - h. Lead acid battery manufacturing.
 - i. Hydrocarbon contaminated soil remediation projects.
 9. Any source for which an applicable federal standard of performance [40 CFR 60] has been adopted in chapter 33.1-15-12.
 10. Any source for which an applicable national emission standard for hazardous air pollutants [40 CFR 61] has been adopted in chapter 33.1-15-13.
 11. Any source which is subject to review under federal prevention of significant deterioration of air quality regulations [40 CFR 51.166].
 12. Any source which is determined by the department to cause or contribute to a violation of any state ambient air quality standard or violates the other provisions of chapter 33.1-15-02.
 13. Any source subject to title V permitting requirements in section 33.1-15-14-06.
 14. Any major source to which a national emission standard for hazardous air pollutants for source categories [40 CFR 63] would apply.
 15. Other stationary sources subject to a standard or requirement under the federal Clean Air Act as amended.

History: Effective January 1, 2019.

General Authority: NDCC 23.1-06-04, 23.1-06-08, 23.1-06-09; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-08; S.L. 2017, ch. 199, § 21

33.1-15-14-01.1. Definitions.

For the purposes of this chapter:

1. "Complete" means, in reference to an application for a permit, that the application contains all the information necessary for processing the application. Designating an application complete for purposes of permit processing does not preclude the department from requesting or accepting any additional information.
2. "Construction, installation, or establishment" means:
 - a. For sources subject to a standard or requirement under chapters 33.1-15-13, 33.1-15-15 (excluding increment consumption by nonmajor sources), and 33.1-15-22, it shall have the meaning given for construction in each of the respective chapters.
 - b. For all other sources it means the onsite placement or erection, including onsite fabrication, demolition, or modification, of an air contaminant emissions unit and any equipment, process, or structure that will be used to reduce, physically or chemically change, or transmit to the atmosphere any air contaminant. This does not include the building that houses the source, site work, foundations, or other equipment which does not affect the amount, ambient concentration, or type of air contaminants that are emitted. With respect to a physical change or a change in the method of operation it means those onsite activities which will affect an existing emissions unit or establishment of a new unit that emits to the atmosphere.
3. "Emissions unit" has the meaning given to it in section 33.1-15-14-06.
4. "Minor source" means any designated air contaminant source under section 33.1-15-14-01 which is not required to obtain a title V permit to operate under section 33.1-15-14-06.
5. "Potential to emit" has the meaning given to it in section 33.1-15-14-06.
6. "Stationary source" has the meaning given to it in section 33.1-15-14-06.

History: Effective January 1, 2019; amended effective July 1, 2020.

General Authority: NDCC 23.1-06-04; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04; S.L. 2017, ch. 199, § 21

33.1-15-14-02. Permit to construct.

1. Permit to construct required.

- a. No construction, installation, or establishment of a new stationary source within a source category designated in section 33.1-15-14-01 may be commenced unless the owner or operator thereof shall file an application for, and receive, a permit to construct in accordance with this chapter.
- b. The initiation of activities that are exempt from the definition of construction, installation, or establishment in section 33.1-15-14-01.1, prior to obtaining a permit to construct, are at the owner's or operator's own risk. These activities have no impact on the department's decision to issue a permit to construct. The initiation or completion of such activities conveys no rights to a permit to construct under this section.
- c. General permits. The department may issue a general permit to construct covering numerous similar sources which are not subject to permitting requirements under chapter 33.1-15-13 or 33.1-15-15 or subpart B of section 33.1-15-22-03. Any general permit shall comply with all requirements applicable to other permits to construct and shall identify

criteria by which sources may qualify for the general permit. A proposed general permit, any changes to a general permit, and any renewal of a general permit is subject to public comment. The public comment procedures under subdivision b of subsection 6 shall be used. To sources that qualify, the department shall grant the conditions and terms of the general permit. Sources that would qualify for a general permit must apply to the department for coverage under the terms of the general permit or apply for an individual permit to construct. Without repeating the public participation procedures under subdivision b of subsection 6, the department may grant a source's request for authorization to construct under the general permit.

2. Application for permit to construct.

- a. Application for a permit to construct a new installation or source must be made by the owner or operator thereof on forms furnished by the department.
- b. A separate application is required for each new installation or source subject to this chapter.
- c. Each application must be signed by the applicant, which signature shall constitute an agreement that the applicant will assume responsibility for the construction or operation of the new installation or source in accordance with this article and will notify the department, in writing, of the startup of operation of such source.

3. Alterations to source.

- a. The addition to or enlargement of or replacement of or alteration in any stationary source, already existing, which is undertaken pursuant to an approved compliance schedule for the reduction of emissions therefrom, shall be exempt from the requirements of this section.
- b. Any physical change in, or change in the method of operation of, a stationary source already existing which increases or may increase the emission rate or increase the ambient concentration by an amount greater than that specified in subdivision a of subsection 5 of any pollutant for which an ambient air quality standard has been promulgated under this article or which results in the emission of any such pollutant not previously emitted must be considered to be construction, installation, or establishment of a new source, except that:
 - (1) Routine maintenance, repair, and replacement may not be considered a physical change.
 - (2) The following may not be considered a change in the method of operation:
 - (a) An increase in the production rate, if such increase does not exceed the operating design capacity of the source and it is not limited by a permit condition.
 - (b) An increase in the hours of operation if it is not limited by a permit condition.
 - (c) Changes from one operating scenario to another provided the alternative operating scenarios are identified and approved in a permit to operate.
 - (d) Trading of emissions within a facility provided:
 - [1] These trades have been identified and approved in a permit to operate; and

- [2] The total facility emissions do not exceed the facility emissions cap established in the permit to operate.
 - (e) Trading and utilizing acid rain allowances provided compliance is maintained with all other applicable requirements.
- c. Any owner or operator of a source who requests an increase in the allowable sulfur dioxide emission rate for the source pursuant to section 33.1-15-02-07 shall demonstrate through a dispersion modeling analysis that the revised allowable emissions will not cause or contribute to a violation of the national ambient air quality standards for sulfur oxides (sulfur dioxide) or the prevention of significant deterioration increments for sulfur dioxide. The owner or operator shall also demonstrate that the revised allowable emission rate will not violate any other requirement of this article or the Federal Clean Air Act. Requests for emission limit changes shall be subject to review by the public and the environmental protection agency in accordance with subsection 6.
- 4. **Submission of plans - Deficiencies in application.** As part of an application for a permit to construct, the department may require the submission of plans, specifications, siting information, emission information, descriptions and drawings showing the design of the installation or source, the manner in which it will be operated and controlled, the emissions expected from it, and the effects on ambient air quality. Any additional information, plans, specifications, evidence, or documentation that the department may require must be furnished upon request. Within twenty days of the receipt of the application, the department shall advise the owner or operator of the proposed source of any deficiencies in the application. In the event of a deficiency, the date of receipt of the application is the date upon which all requested information is received.
 - a. Determination of the effects on ambient air quality as may be required under this section must be based on the applicable requirements specified in the "Guideline on Air Quality Models (Revised)" (United States environmental protection agency, office of air quality planning and standards, Research Triangle Park, North Carolina 27711) as it exists on July 1, 2019.
 - b. When an air quality impact model specified in the documents incorporated by reference in subdivision a is inappropriate, the model may be modified or another model substituted provided:
 - (1) Any modified or nonguideline model must be subject to notice and opportunity for public comment under subsection 6.
 - (2) The applicant must provide to the department adequate information to evaluate the applicability of the modified or nonguideline model. Such information must include, but is not limited to, methods like those outlined in the "Interim Procedures for Evaluating Air Quality Models (Revised)" (United States environmental protection agency, office of air quality planning and standards, Research Triangle Park, North Carolina 27709).
 - (3) Written approval from the department must be obtained for any modification or substitution.
 - (4) Written approval from the United States environmental protection agency must be obtained for any modification or substitution prior to the granting of a permit under this chapter.
- 5. **Review of application - Standard for granting permits to construct.** The department shall review any plans, specifications, and other information submitted in an application for a permit

to construct and from such review shall, within ninety days of the receipt of the completed application, make the following preliminary determinations:

- a. Whether the proposed project will be in accord with this article, including whether the operation of any new stationary source at the proposed location will cause or contribute to a violation of any applicable ambient air quality standard. A new stationary source will be considered to cause or contribute to a violation of an ambient air quality standard when such source would, at a minimum, exceed the following significance levels at any locality that does not or would not meet the applicable ambient standard:

<u>Contaminant</u>	<u>Averaging Time (hours)</u>				
	Annual ($\mu\text{g}/\text{m}^3$)	24 ($\mu\text{g}/\text{m}^3$)	8 ($\mu\text{g}/\text{m}^3$)	3 ($\mu\text{g}/\text{m}^3$)	1 ($\mu\text{g}/\text{m}^3$)
SO ₂	1.0	5		25	7.8
PM ₁₀		5			
NO ₂	1.0				7.5
CO			500		2000
PM _{2.5}	0.2	1.2			
Ozone			2.0		

- b. Whether the proposed project will provide all necessary and reasonable methods of emission control. Whenever a standard of performance is applicable to the source, compliance with this criterion will require provision for emission control which will, at least, satisfy such standards.

6. Public participation - Final action on application.

- a. The following source categories are subject to the public participation procedures under this subsection:
 - (1) Those affected facilities designated under chapter 33.1-15-13.
 - (2) New sources that will be required to obtain a permit to operate under section 33.1-15-14-06.
 - (3) Modifications to an existing facility which will increase the potential to emit from the facility by the following amounts:
 - (a) One hundred tons [90.72 metric tons] per year or more of particulate matter, sulfur dioxide, nitrogen oxides, hydrogen sulfide, carbon monoxide, or volatile organic compounds;
 - (b) Ten tons [9.07 metric tons] per year or more of any contaminant listed under section 112(b) of the federal Clean Air Act; or
 - (c) Twenty-five tons [22.68 metric tons] per year or more of any combination of contaminants listed under section 112(b) of the federal Clean Air Act.
 - (4) Sources which the department has determined to have a major impact on air quality.
 - (5) Those for which a request for a public comment period has been received from the public.

- (6) Sources for which a significant degree of public interest exists regarding air quality issues.
 - (7) Those sources which request a federally enforceable permit which limits their potential to emit.
- b. With respect to the permit to construct application, the department shall:
- (1) Within ninety days of receipt of a complete application, make a preliminary determination concerning issuance of a permit to construct.
 - (2) Within ninety days of the receipt of the complete application, make available in at least one location in the county or counties in which the proposed project is to be located or on the department's website, a copy of its preliminary determinations and copies of or a summary of the information considered in making such preliminary determinations.
 - (3) Publish notice to the public by prominent advertisement, within ninety days of the receipt of the complete application, in the region affected, of the opportunity for written comment on the preliminary determinations. The public notice must include the proposed location of the source.
 - (4) Within ninety days of the receipt of the complete application, deliver a copy of the notice to the applicant and to officials and agencies having cognizance over the locations where the source will be situated as follows: the chief executive of the city and county; any comprehensive regional land use planning agency; and any state, federal land manager, or Indian governing body whose lands will be significantly affected by the source's emissions.
 - (5) Within ninety days of receipt of a complete application, provide a copy of the proposed permit and all information considered in the development of the permit and the public notice to the regional administrator of the United States environmental protection agency.
 - (6) Allow thirty days for public comment.
 - (7) Consider all public comments properly received, in making the final decision on the application.
 - (8) Allow the applicant to submit written responses to public comments received by the department. The applicant's responses must be submitted to the department within twenty days of the close of the public comment period.
 - (9) Take final action on the application within thirty days of the applicant's response to the public comments.
 - (10) Provide a copy of the final permit, if issued, to the applicant, the regional administrator of the United States environmental protection agency, and anyone who requests a copy.
- c. For those sources subject to the requirements of chapter 33.1-15-15, the public participation procedures under section 33.1-15-15-01.2 shall be followed.
7. **Denial of permit to construct.** If, after review of all information received, including public comment with respect to any proposed project, the department makes the determination of any one of subdivision a or b of subsection 5 in the negative, it shall deny the permit and notify the applicant, in writing, of the denial to issue a permit to construct.

If a permit to construct is denied, the construction, installation, or establishment of the new stationary source shall be unlawful. No permit to construct or modify may be granted if such construction, or modification, or installation, will result in a violation of this article.

8. **Issuance of permit to construct.** If, after review of all information received, including public comment with respect to any proposed project, the department makes the determination of subdivision a and b of subsection 5 in the affirmative, the department shall issue a permit to construct. The permit may provide for conditions of operation as provided in subsection 9.
9. **Permit to construct - Conditions.** The department may impose any reasonable conditions upon a permit to construct, including conditions concerning:
 - a. Sampling, testing, and monitoring of the facilities or the ambient air or both.
 - b. Trial operation and performance testing.
 - c. Prevention and abatement of nuisance conditions caused by operation of the facility.
 - d. Recordkeeping and reporting.
 - e. Compliance with applicable rules and regulations in accordance with a compliance schedule.
 - f. Limitation on hours of operation, production rate, processing rate, or fuel usage when necessary to assure compliance with this article.

The violation of any conditions so imposed may result in revocation or suspension of the permit or other appropriate enforcement action.

10. **Scope.**
 - a. The issuance of a permit to construct for any source does not affect the responsibility of an owner or operator to comply with applicable portions of a control strategy affecting the source.
 - b. A permit to construct shall become invalid if construction is not commenced within eighteen months after receipt of such permit, if construction is discontinued for a period of eighteen months or more; or if construction is not completed within a reasonable time. The department may extend the eighteen-month period upon a satisfactory showing that an extension is justified. This provision does not apply to the time period between construction of the approved phases of a phased construction project; each phase must commence construction within eighteen months of the projected and approved commencement date. In cases of major construction projects involving long lead times and substantial financial commitments, the department may provide by a condition to the permit a time period greater than eighteen months when such time extension is supported by sufficient documentation by the applicant.
11. **Transfer of permit to construct.** To ensure the responsible owners or operators, or both, are identified, the holder of a permit to construct may not transfer such permit without prior approval of the department.
12. **[Reserved].**
13. **Exemptions.** A permit to construct is not required for the following stationary sources provided there is no federal requirement for a permit or approval for construction or operation.
 - a. Maintenance, structural changes, or minor repair of process equipment, fuel burning equipment, control equipment, or incinerators which do not change capacity of such

process equipment, fuel burning equipment, control equipment, or incinerators and which do not involve any change in the quality, nature, or quantity of emissions therefrom.

- b. Fossil fuel burning equipment, other than smokehouse generators, which meet all of the following criteria:
 - (1) The heat input per unit does not exceed ten million British thermal units per hour.
 - (2) The total aggregate heat input from all equipment does not exceed ten million British thermal units per hour.
 - (3) The actual emissions, as defined in chapter 33.1-15-15, from all equipment do not exceed twenty-five tons [22.67 metric tons] per year of any air contaminant and the potential to emit any air contaminant for which an ambient air quality standard has been promulgated in chapter 33.1-15-02 is less than one hundred tons [90.68 metric tons] per year.
- c.
 - (1) Any single internal combustion engine with less than five hundred brake horsepower, or multiple engines with a combined brake horsepower rating less than five hundred brake horsepower.
 - (2) Any single internal combustion engine with a maximum rating of less than one thousand brake horsepower, or multiple engines with a combined brake horsepower rating of less than one thousand brake horsepower, and which operates a total of five hundred hours or less in a rolling twelve-month period.
 - (3) Any internal combustion engine, or multiple engines at the same facility, with a total combined actual emission rate of five tons [4.54 metric tons] per year or less of any air contaminant for which an ambient air quality standard has been promulgated in section 33.1-15-02-04.
 - (4) The exemptions listed in paragraphs 1, 2, and 3 do not apply to engines that are a utility unit as defined in section 33.1-15-21-08.1.
- d. Bench scale laboratory equipment used exclusively for chemical or physical analysis or experimentation.
- e. Portable brazing, soldering, or welding equipment.
- f. The following equipment:
 - (1) Comfort air-conditioners or comfort ventilating systems which are not designed and not intended to be used to remove emissions generated by or released from specific units or equipment.
 - (2) Water cooling towers and water cooling ponds unless used for evaporative cooling of process water, or for evaporative cooling of water from barometric jets or barometric condensers or used in conjunction with an installation requiring a permit.
 - (3) Equipment used exclusively for steam cleaning.
 - (4) Porcelain enameling furnaces or porcelain enameling drying ovens.
 - (5) Unheated solvent dispensing containers or unheated solvent rinsing containers of sixty gallons [227.12 liters] capacity or less.
 - (6) Equipment used for hydraulic or hydrostatic testing.

- g. The following equipment or any exhaust system or collector serving exclusively such equipment:
 - (1) Blast cleaning equipment using a suspension of abrasive in water.
 - (2) Bakery ovens if the products are edible and intended for human consumption.
 - (3) Kilns for firing ceramic ware, heated exclusively by gaseous fuels, singly or in combinations, and electricity.
 - (4) Confection cookers if the products are edible and intended for human consumption.
 - (5) Drop hammers or hydraulic presses for forging or metalworking.
 - (6) Diecasting machines.
 - (7) Photographic process equipment through which an image is reproduced upon material through the use of sensitized radiant energy.
 - (8) Equipment for drilling, carving, cutting, routing, turning, sawing, planing, spindle sanding, or disc sanding of wood or wood products, which is located within a facility that does not vent to the outside air.
 - (9) Equipment for surface preparation of metals by use of aqueous solutions, except for acid solutions.
 - (10) Equipment for washing or drying products fabricated from metal or glass; provided, that no volatile organic materials are used in the process and that no oil or solid fuel is burned.
 - (11) Laundry dryers, extractors, or tumblers for fabrics cleaned with only water solutions of bleach or detergents.
- h. Natural draft hoods or natural draft ventilators.
- i. Containers, reservoirs, or tanks used exclusively for:
 - (1) Dipping operations for coating objects with oils, waxes, or greases, if no organic solvents are used.
 - (2) Dipping operations for applying coatings of natural or synthetic resins which contain no organic solvents.
 - (3) Storage of butane, propane, or liquefied petroleum or natural gas.
 - (4) Storage of lubricating oils.
 - (5) Storage of petroleum liquids except those containers, reservoirs, or tanks subject to the requirements of chapter 33.1-15-12.
- j. Gaseous fuel-fired or electrically heated furnaces for heat treating glass or metals, the use of which does not involve molten materials.
- k. Crucible furnaces, pot furnaces, or induction furnaces, with a capacity of one thousand pounds [453.59 kilograms] or less each, unless otherwise noted, in which no sweating or distilling is conducted, nor any fluxing conducted utilizing chloride, fluoride, or ammonium compounds, and from which only the following metals are poured or in which only the following metals are held in a molten state:

- (1) Aluminum or any alloy containing over fifty percent aluminum; provided, that no gaseous chlorine compounds, chlorine, aluminum chloride, or aluminum fluoride are used.
 - (2) Magnesium or any alloy containing over fifty percent magnesium.
 - (3) Lead or any alloy containing over fifty percent lead, in a furnace with a capacity of five hundred fifty pounds [249.48 kilograms] or less.
 - (4) Tin or any alloy containing over fifty percent tin.
 - (5) Zinc or any alloy containing over fifty percent zinc.
 - (6) Copper.
 - (7) Precious metals.
- l. Open burning activities within the scope of section 33.1-15-04-02.
 - m. Flares used to indicate some danger to the public.
 - n. Sources or alterations to a source which are of minor significance as determined by the department.
 - o. Oil and gas production facilities as defined in chapter 33.1-15-20 which are not a major source as defined in section 33.1-15-14-06.
14. **Performance and emission testing.**
- a. Emission tests or performance tests or both shall be conducted by the owner or operator of a facility and data reduced in accordance with the applicable procedure, limitations, standards, and test methods established by this article. Such tests must be conducted under the owner's or operator's permit to construct, and such permit is subject to the faithful completion of the test in accordance with this article.
 - b. All dates and periods of trial operation for the purpose of performance or emission testing pursuant to a permit to construct must be approved in advance by the department. Trial operation shall cease if the department determines, on the basis of the test results, that continued operation will result in the violation of this article. Upon completion of any test conducted under a permit to construct, the department may order the cessation of the operation of the tested equipment or facility until such time as a permit to operate has been issued by the department.
 - c. Upon review of the performance data resulting from any test, the department may require the installation of such additional control equipment as will bring the facility into compliance with this article.
 - d. Nothing in this article may be construed to prevent the department from conducting any test upon its own initiative, or from requiring the owner or operator to conduct any test at such time as the department may determine.
15. **Responsibility to comply.**
- a. Possession of a permit to construct does not relieve any person of the responsibility to comply with this article.

- b. The exemption of any stationary source from the requirements of a permit to construct by reason of inclusion in subsection 13 does not relieve the owner or operator of such source of the responsibility to comply with any other applicable portions of this article.
- 16. **Portable sources.** Sources which are designated to be portable and which are not subject to the requirements of chapter 33.1-15-15 are exempt from requirements to obtain a permit to construct. The owner or operator shall submit an application for a permit to operate prior to initiating operations.
- 17. **Registration of exempted stationary sources.** The department may require that the owner or operator of any stationary source exempted under subsection 13 shall register the source with the department within such time limits and on such forms as the department may prescribe.
- 18. **Extensions of time.** The department may extend any of the time periods specified in subsections 4, 5, and 6 upon notification of the applicant by the department.
- 19. **Amendment of permits.** The department may, when the public interest requires or when necessary to ensure the accuracy of the permit, modify any condition or information contained in the permit to construct. Modification shall be made only upon the department's own motion and the procedure shall, at a minimum, conform to any requirements of federal and state law. In the event that the modification would be a major modification as defined in chapter 33.1-15-15, the department shall follow the procedures established in chapter 33.1-15-15. For those of concern to the public, the department will provide:
 - a. Reasonable notice to the public, in the area to be affected, of the opportunity for comment on the proposed modification, and the opportunity for a public hearing, upon request, as well as written public comment.
 - b. A minimum of a thirty-day period for written public comment, with the opportunity for a public hearing during that thirty-day period, upon request.
 - c. Consideration by the department of all comments received in its order for modification.

The department may require the submission of such maps, plans, specifications, emission information, and compliance schedules as it deems necessary prior to the issuance of an amendment. It is the intention of the department that this subsection shall apply only in those instances allowed by federal rules and regulations and only in those instances in which the granting of a variance pursuant to section 33.1-15-01-06 and enforcement of existing permit conditions are manifestly inappropriate.

History: Effective January 1, 2019; amended effective July 1, 2020.

General Authority: NDCC 23.1-06-04, 23.1-06-08, 23.1-06-09; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-08, 23.1-06-09; S.L. 2017, ch. 199, § 21

33.1-15-14-03. Minor source permit to operate.

1. Permit to operate required.

- a. Except as provided in subdivisions c and d, no person may operate or cause the routine operation of an installation or source designated in section 33.1-15-14-01 without applying for and obtaining, in accordance with this section, a permit to operate. Application for a permit to operate a new installation or source must be made at least thirty days prior to startup of routine operation. Those sources that received a permit to construct under section 33.1-15-14-02, need only submit a thirty-day prior notice of proposed startup to satisfy the requirement to apply for a permit to operate under this subdivision.

- b. No person may operate or cause the operation of an installation or source in violation of any permit to operate or any condition imposed upon a permit to operate or in violation of this article.
 - c. Sources that are subject to the title V permitting requirements of section 33.1-15-14-06 are exempt from the requirements of this section.
 - d. Sources that are exempt from the requirement to obtain a permit to construct under subsection 13 of section 33.1-15-14-02 are exempt from this section.
 - e. Sources which are subject to the title V permitting requirements in section 33.1-15-14-06 based solely on their potential to emit may apply for a federally enforceable minor source permit to operate which would limit their potential to emit to a level below the title V permit to operate applicability threshold.
 - f. Permits which are issued under this section which do not conform to the requirements of this section, including public participation under subdivision a of subsection 5 of section 33.1-15-14-03, and the requirements of any United States environmental protection agency regulations may be deemed not federally enforceable by the United States environmental protection agency.
 - g. General permits. The department may issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to other minor source permits to operate and shall identify criteria by which sources may qualify for the general permit. To sources that qualify, the department shall grant the conditions and terms of the general permit. Sources that would qualify for a general permit must apply to the department for coverage under the terms of the general permit or apply for an individual minor source permit to operate. Without repeating the public participation procedures under subsection 5 of section 33.1-15-14-03, the department may grant a source's request for authorization to operate under a general permit.
2. **Application for permit to operate.**
- a. Application for a permit to operate must be made by the owner or operator thereof on forms furnished by the department.
 - b. Each application for a permit to operate must be accompanied by such performance tests results, information, and records as may be required by the department to determine whether the requirements of this article will be met. Such information may also be required by the department at any time when the source is being operated to determine compliance with this article.
 - c. Each application must be signed by the applicant, which signature shall constitute an agreement that the applicant will assume responsibility for the operation of the installation or source in accordance with this article.
3. **Standards for granting permits to operate.** No permit to operate may be granted unless the applicant shows to the satisfaction of the department that the source is in compliance with this article.
4. **Performance testing.**
- a. Before a permit to operate is granted, the applicant, if required by the department, shall conduct performance tests in accordance with methods and procedures required by this article or methods and procedures approved by the department. Such tests must be made at the expense of the applicant. The department may monitor such tests and may also conduct performance tests.

- b. Emission tests or performance tests or both shall be conducted by the owner or operator of a facility and data reduced in accordance with the applicable procedure, limitations, standards, and test methods established by this article. Issuance of a minor source permit to operate is subject to the faithful completion of the test in accordance with this article.
 - c. All dates and periods of trial operation for the purpose of performance or emission testing pursuant to a permit to operate must be approved in advance by the department. Trial operation shall cease if the department determines, on the basis of the test results, that continued operation will result in the violation of this article. Upon completion of any test conducted under a permit to construct, the department may order the cessation of the operation of the tested equipment or facility until such time as a permit to operate has been issued by the department.
 - d. Upon review of the performance data resulting from any test, the department may require the installation of such additional control equipment as will bring the facility into compliance with this article.
 - e. Nothing in this article may be construed to prevent the department from conducting any test upon its own initiative or from requiring the owner or operator to conduct any test at such time as the department may determine.
5. **Action on applications.**
- a. Public participation. This subdivision is applicable to only those sources which apply for a federally enforceable minor source permit to operate which limits their potential to emit an air contaminant. The department shall:
 - (1) Within ninety days of receipt of a complete application:
 - (a) Make a preliminary determination concerning issuance of the permit to operate.
 - (b) Make available in at least one location in the county or counties in which the source is located or on the department's website, a copy of the proposed permit and copies of or a summary of the information considered in developing the permit.
 - (c) Publish notice to the public by prominent advertisement, in the region affected, of the opportunity for written comment on the proposed permit. The public notice must include the proposed location of the source.
 - (d) Provide notice of the proposed permit and public notice to any state or federal land manager, or Indian governing body whose lands will be significantly affected by the source's emissions. For purposes of this subparagraph, lands will be considered to be significantly affected if the source is located within thirty-one and seven hundredths miles [50 kilometers] of such land.
 - (e) Provide a copy of the proposed permit, all information considered in the development of the permit and the public notice to the regional administrator of the United States environmental protection agency.
 - (2) Allow thirty days for public comment.
 - (3) Consider all public comments properly received, in making the final decision on the application.

- (4) Allow the applicant to submit written responses to public comments received by the department. The applicant's responses must be submitted to the department within twenty days of the close of the public comment period.
 - (5) Take final action on the application within thirty days of the applicant's response to the public comments.
 - (6) Provide a copy of the final permit, if issued, to the applicant, the regional administrator of the United States environmental protection agency, and anyone who requests a copy.
 - b. For those sources not subject to public participation under subdivision a, the department shall act within thirty days after receipt of an application for a permit to operate a new installation or source, and within thirty days after receipt of an application to operate an existing installation or source, and shall notify the applicant, in writing, of the approval, conditional approval, or denial of the application.
 - c. The department shall set forth in any notice of denial the reasons for denial. A denial must be without prejudice to the applicant's right to a hearing before the department or for filing a further application after revisions are made to meet objections specified as reasons for the denial.
6. **Permit to operate - Conditions.** The department may impose any reasonable conditions upon a permit to operate. All emission limitations, controls, and other requirements imposed by conditions on the permit to operate must be at least as stringent as any applicable limitation or requirement contained in this article. Permit to operate conditions may include:
- a. Sampling, testing, and monitoring of the facilities or ambient air or both.
 - b. Trial operation and performance testing.
 - c. Prevention and abatement of nuisance conditions caused by operation of the facility.
 - d. Recordkeeping and reporting.
 - e. Compliance with applicable rules and regulations in accordance with a compliance schedule.
 - f. Limits on the hours of operation of a source or its processing rate, fuel usage, or production rate when necessary to assure compliance with this article.
7. **Suspension or revocation of permit to operate.**
- a. The department may suspend or revoke a permit to operate for violation of this article, violations of a permit condition, or failure to respond to a notice of violation or any order issued pursuant to this article.
 - b. Suspension or revocation of a permit to operate shall become final ten days after serving notice on the holder of the permit.
 - c. A permit to operate which has been revoked pursuant to this article must be surrendered forthwith to the department.
 - d. No person may operate or cause the operation of an installation or source if the department denies or revokes a permit to operate.
8. **Transfer of permit to operate.** The holder of a permit to operate may not transfer it without the prior approval of the department.

9. **Renewal of permit to operate.** Every permit to operate issued by the department after February 9, 1976, must have a maximum term of five years. Applications for renewal of such permits must be submitted ninety days prior to the expiration date stated in the permit. The department shall approve or disapprove such application within ninety days. If a source submits a complete application for a permit renewal at least ninety days prior to the expiration date, the source's failure to have a minor source permit to operate is not a violation of this section until the department takes final action on the renewal application.
10. **[Reserved].**
11. **[Reserved].**
12. **Responsibility to comply.**
 - a. Possession of a minor source permit to operate does not relieve any person of the responsibility to comply with this article.
 - b. The exemption of any stationary source from the requirements to obtain a minor source permit to operate does not relieve the owner or operator of such source of the responsibility to comply with any other applicable portions of this article.
13. **Portable sources.** Sources which are designed to be portable and which are operated at temporary jobsites across the state may not be considered a new source by virtue of location changes. One application for a permit to operate any portable source may be filed in accordance with this chapter, and subsequent applications are not required for each temporary jobsite. The permit to operate issued by the department shall be conditioned by such specific requirements as the department deems appropriate to carry out the provisions of sections 33.1-15-01-07 and 33.1-15-01-15.
14. **Registration of exempted stationary sources.** The department may require that the owner or operator of any stationary source exempted from the requirement to obtain a minor source permit to operate to register the source with the department within such time limits and on such forms as the department may prescribe.
15. **Extensions of time.** The department may extend any of the time periods specified in this section upon notification of the applicant by the department.
16. **Amendment of permits.** When the public interest requires or when necessary to ensure the accuracy of the permit, the department may modify any condition or information contained in a minor source permit to operate. Modification shall be made only upon the department's own motion and the procedure shall, at a minimum, conform to any requirements of federal and state law. In the event that the modification would be a major modification as defined in chapter 33.1-15-15, the department shall follow the procedures established in chapter 33.1-15-15. For those of concern to the public, or modify a condition which limits the potential to emit of a source which possesses a federally enforceable permit, the department will provide:
 - a. Reasonable notice to the public, in the area to be affected, of the opportunity for comment on the proposed modification and the opportunity for a public hearing, upon request, as well as written public comment.
 - b. A minimum of a thirty-day period for written public comment with the opportunity for a public hearing during that thirty-day period, upon request.
 - c. Consideration by the department of all comments received.

The department may require the submission of such maps, plans, specifications, emission information, and compliance schedules as it deems necessary prior to the issuance of an amendment. It is the intention of the department that this subsection shall apply only in those instances allowed by federal rules and regulations and only in those instances in which the granting of a variance pursuant to section 33.1-15-01-06 and enforcement of existing permit conditions are manifestly inappropriate.

History: Effective January 1, 2019.

General Authority: NDCC 23.1-06-04, 23.1-06-09; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-09; S.L. 2017, ch. 199, § 21

33.1-15-14-04. [Reserved].

33.1-15-14-05. [Reserved].

33.1-15-14-06. Title V permit to operate.

1. **Definitions.** For purposes of this section:

- a. "Affected source" means any source that includes one or more affected units.
- b. "Affected state" means any state that is contiguous to North Dakota whose air quality may be affected by a source subject to a proposed title V permit, permit modification, or permit renewal or which is within fifty miles [80.47 kilometers] of the permitted source.
- c. "Affected unit" means a unit that is subject to any acid rain emissions reduction requirement or acid rain emissions limitation under title IV of the federal Clean Air Act.
- d. "Alternative operating scenario (AOS)" means a scenario authorized in a title V permit that involves a change at the title V source for a particular emissions unit, and that either results in the unit being subject to one or more applicable requirements which differ from those applicable to the emissions unit prior to implementation of the change or renders inapplicable one or more requirements previously applicable to the emissions unit prior to implementation of the change.
- e. "Applicable requirement" means all of the following as they apply to emissions units at a source that is subject to requirements of this section (including requirements that have been promulgated or approved by the United States environmental protection agency through rulemaking at the time of issuance but have future-effective compliance dates):
 - (1) Any standard or other requirement provided for in the North Dakota state implementation plan approved or promulgated by the United States environmental protection agency through rulemaking under title I of the federal Clean Air Act that implements the relevant requirements of the federal Clean Air Act, including any revisions to that plan.
 - (2) Any term or condition of any permit to construct issued pursuant to this chapter.
 - (3) Any standard or other requirement under section 111 including section 111(d) of the federal Clean Air Act.
 - (4) Any standard or other requirement under section 112 of the federal Clean Air Act including any requirement concerning accident prevention under section 112(r)(7) of the federal Clean Air Act.

- (5) Any standard or other requirement of the acid rain program under title IV of the federal Clean Air Act.
 - (6) Any requirements established pursuant to section 504(b) or section 114(a)(3) of the federal Clean Air Act.
 - (7) Any standard or other requirement governing solid waste incineration, under section 129 of the federal Clean Air Act.
 - (8) Any standard or other requirement for consumer and commercial products, under section 183(e) of the federal Clean Air Act.
 - (9) Any standard or other requirement for tank vessels under section 183(f) of the federal Clean Air Act.
 - (10) Any standard or other requirement of the program to control air pollution from outer continental shelf sources, under section 328 of the federal Clean Air Act.
 - (11) Any standard or other requirement of the regulations promulgated to protect stratospheric ozone under title VI of the federal Clean Air Act, unless the administrator of the United States environmental protection agency has determined that such requirements need not be contained in a title V permit.
 - (12) Any national ambient air quality standard or increment or visibility requirement under part C of title I of the federal Clean Air Act, but only as it would apply to temporary sources permitted pursuant to section 504(e) of the federal Clean Air Act.
- f. "Approved replicable methodology (ARM)" means title V permit terms that:
- (1) Specify a protocol which is consistent with and implements an applicable requirement, or requirement of this section, such that the protocol is based on sound scientific or mathematical principles, or both, and provides reproducible results using the same inputs; and
 - (2) Require the results of that protocol to be recorded and used for assuring compliance with such applicable requirement, any other applicable requirement implicated by implementation of the approved replicable methodology, or requirement of this section, including where an approved replicable methodology is used for determining applicability of a specific requirement to a particular change.
- g. "Designated representative" means a responsible natural person authorized by the owners and operators of an affected source and of all affected units at the source, as evidenced by a certificate of representation submitted in accordance with subpart B of 40 CFR 72, to represent and legally bind each owner and operator, as a matter of federal law, in matters pertaining to the acid rain program. Whenever the term "responsible official" is used in this section, or in any other regulations implementing title V of the federal Clean Air Act, it shall be deemed to refer to the "designated representative" with regard to all matters under the acid rain program.
- h. "Draft permit" means the version of a permit for which the department offers public participation or affected state review.
- i. "Emergency" means any situation arising from sudden and reasonably unforeseeable events beyond the control of the source, including acts of God, which situation requires immediate corrective action to restore normal operation, and that causes the source to exceed a technology-based emission limitation under the title V permit to operate, due to unavoidable increases in emissions attributable to the emergency. An emergency shall

not include noncompliance to the extent caused by improperly designed equipment, lack of preventive maintenance, careless or improper operation, or operator error.

- j. "Emissions allowable under the permit" means a federally enforceable permit term or condition determined at issuance to be required by an applicable requirement that establishes an emissions limit (including a work practice standard) or a federally enforceable emissions cap that the source has assumed to avoid an applicable requirement to which the source would otherwise be subject.
- k. "Emissions unit" means any part or activity of a stationary source that emits or has the potential to emit any regulated air contaminant or any contaminant listed under section 112(b) of the federal Clean Air Act. This term does not alter or affect the definition of unit for purposes of title IV of the federal Clean Air Act.
- l. "Environmental protection agency" or the "administrator" means the administrator of the United States environmental protection agency or the administrator's designee.
- m. "Federal Clean Air Act" means the federal Clean Air Act, as amended [42 U.S.C. 7401 et seq.].
- n. "Final permit" means the version of a title V permit issued by the department that has completed all review procedures required in this section.
- o. "Fugitive emissions" are those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.
- p. "General permit" means a title V permit to operate that meets the requirements of subdivision d of subsection 5.
- q. "Major source" means any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person (or persons under common control)) belonging to a single major industrial grouping and that are described in paragraph 1 or 2. For the purposes of defining "major source", a stationary source or group of stationary sources shall be considered part of a single industrial grouping if all of the contaminant emitting activities at such source or group of sources on contiguous or adjacent properties belong to the same major group (i.e., all have the same two-digit code) as described in the standard industrial classification manual, 1987.

(1) A major source under section 112 of the federal Clean Air Act, which is defined as:

- (a) For contaminants other than radionuclides, any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit, in the aggregate, ten tons [9.07 metric tons] per year (tpy) or more of any hazardous air contaminant which has been listed pursuant to section 112(b) of the federal Clean Air Act, twenty-five tons [22.67 metric tons] per year or more of any combination of such hazardous air contaminants, or such lesser quantity as the administrator of the United States environmental protection agency may establish by rule. Notwithstanding the preceding sentence, emissions from any oil or gas exploration or production well (with its associated equipment) and emissions from any pipeline compressor pump station shall not be aggregated with emissions from other similar units, whether or not such units are in a contiguous area or under common control, to determine whether such units or stations are major sources.

- (b) For radionuclides, "major source" shall have the meaning specified by the administrator of the United States environmental protection agency by rule.
- (2) A major stationary source of air contaminants, that directly emits or has the potential to emit, one hundred tons [90.68 metric tons] per year or more of any air contaminant subject to regulation (including any major source of fugitive emissions of any such contaminant, as determined by rule by the administrator of the United States environmental protection agency). For purposes of this definition, air contaminant subject to regulation does not include greenhouse gases as defined in title 40 Code of Federal Regulations 86.1818-12(a). The fugitive emissions of a stationary source shall not be considered in determining whether it is a major stationary source for the purposes of this section, unless the source belongs to one of the following categories of stationary source:
- (a) Coal cleaning plants (with thermal dryers).
 - (b) Kraft pulp mills.
 - (c) Portland cement plants.
 - (d) Primary zinc smelters.
 - (e) Iron and steel mills.
 - (f) Primary aluminum ore reduction plants.
 - (g) Primary copper smelters.
 - (h) Municipal incinerators capable of charging more than two hundred fifty tons [226.80 metric tons] of refuse per day.
 - (i) Hydrofluoric, sulfuric, or nitric acid plants.
 - (j) Petroleum refineries.
 - (k) Lime plants.
 - (l) Phosphate rock processing plants.
 - (m) Coke oven batteries.
 - (n) Sulfur recovery plants.
 - (o) Carbon black plants (furnace process).
 - (p) Primary lead smelters.
 - (q) Fuel conversion plants.
 - (r) Sintering plants.
 - (s) Secondary metal production plants.
 - (t) Chemical process plants.
 - (u) Fossil-fuel boilers (or combination thereof) totaling more than two hundred fifty million British thermal units per hour heat input.

- (v) Petroleum storage and transfer units with a total storage capacity exceeding three hundred thousand barrels.
 - (w) Taconite ore processing plants.
 - (x) Glass fiber processing plants.
 - (y) Charcoal production plants.
 - (z) Fossil-fuel-fired steam electric plants of more than two hundred fifty million British thermal units per hour heat input.
 - (aa) Any other stationary source category which as of August 7, 1980, is being regulated under section 111 or 112 of the federal Clean Air Act.
- r. "Permit modification" means a revision to a title V permit that meets the requirements of subdivision e of subsection 6.
 - s. "Permit program costs" means all reasonable (direct and indirect) costs required to develop and administer a permit program, under this section (whether such costs are incurred by the department or other state or local agencies that do not issue permits directly, but that support permit issuance or administration).
 - t. "Permit revision" means any permit modification or administrative permit amendment.
 - u. "Potential to emit" means the maximum capacity of a stationary source to emit any air contaminant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air contaminant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation is enforceable by the administrator of the United States environmental protection agency and the department.
 - v. "Proposed permit" means the version of a permit that the department proposes to issue and forwards to the administrator of the United States environmental protection agency for review.
 - w. "Regulated air contaminant" means the following:
 - (1) Nitrogen oxides or any volatile organic compounds.
 - (2) Any contaminant for which a national ambient air quality standard has been promulgated.
 - (3) Any contaminant that is subject to any standard promulgated under section 111 of the federal Clean Air Act.
 - (4) Any class I or II substance subject to a standard promulgated under or established by title VI of the federal Clean Air Act.
 - (5) Any contaminant subject to a standard promulgated under section 112 or other requirements established under section 112 of the federal Clean Air Act, including sections 112(g), (j), and (r) of the federal Clean Air Act, including the following:
 - (a) Any contaminant subject to requirements under section 112(j) of the federal Clean Air Act. If the administrator fails to promulgate a standard by the date established pursuant to section 112(e) of the federal Clean Air Act, any contaminant for which a subject source would be major shall be considered to

be regulated on the date eighteen months after the applicable date established pursuant to section 112(e) of the federal Clean Air Act; and

- (b) Any contaminant for which the requirements of section 112(g)(2) of the federal Clean Air Act have been met, but only with respect to the individual source subject to section 112(g)(2) of the federal Clean Air Act requirement.
- x. "Regulated contaminant" for fee calculation, which is used only for chapter 33.1-15-23, means any "regulated air contaminant" except the following:
- (1) Carbon monoxide.
 - (2) Any contaminant that is a regulated air contaminant solely because it is a class I or II substance subject to a standard promulgated under or established by title VI of the federal Clean Air Act.
 - (3) Any contaminant that is a regulated air contaminant solely because it is subject to a standard or regulation under section 112(r) of the federal Clean Air Act.
 - (4) Greenhouse gases.
- y. "Renewal" means the process by which a permit is reissued at the end of its term.
- z. "Responsible official" means one of the following:
- (1) For a corporation: a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decisionmaking functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:
 - (a) The facilities employ more than two hundred fifty persons or have gross annual sales or expenditures exceeding twenty-five million dollars (in second quarter 1980 dollars).
 - (b) The delegation of authority to such representatives is approved in advance by the department.
 - (2) For a partnership or sole proprietorship: a general partner or the proprietor, respectively.
 - (3) For a municipality, state, federal, or other public agency: either a principal executive officer or ranking elected official. For the purposes of this section, a principal executive officer of a federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., a regional administrator of the United States environmental protection agency).
 - (4) For affected sources:
 - (a) The designated representative insofar as actions, standards, requirements, or prohibitions under title IV of the federal Clean Air Act or the regulations promulgated thereunder are concerned.
 - (b) The designated representative for any other purposes under this section.

- aa. "Section 502(b)(10) changes" are changes that contravene an express permit term. Such changes do not include changes that would violate applicable requirements or contravene federally enforceable permit terms and conditions that are monitoring (including test methods), recordkeeping, reporting, or compliance certification requirements.
- bb. "Stationary source" means any building, structure, facility, or installation that emits or may emit any regulated air contaminant or any contaminant listed under section 112(b) of the federal Clean Air Act.
- cc. "Subject to regulation" means, for any air contaminant, that the air contaminant is subject to either a provision in the federal Clean Air Act, or a nationally applicable regulation codified by the administrator of the United States environmental protection agency in title 40 Code of Federal Regulations chapter I, subchapter C, that requires actual control of the quantity of emissions of that air contaminant, and that such a control requirement has taken effect and is operative to control, limit, or restrict the quantity of emissions of that air contaminant release from the regulated activity.
- dd. "Title V permit to operate or permit" (unless the context suggests otherwise) means any permit or group of permits covering a source that is subject to this section that is issued, renewed, amended, or revised pursuant to this section.
- ee. "Title V source" means any source subject to the permitting requirements of this section, as provided in subsection 2.

2. **Applicability.**

- a. This section is applicable to the following sources:
 - (1) Any major source.
 - (2) Any source, including an area source, subject to a standard, limitation, or other requirement under section 111 of the federal Clean Air Act.
 - (3) Any source, including an area source, subject to a standard or other requirement under section 112 of the federal Clean Air Act, except that a source is not required to obtain a permit solely because it is subject to regulations or requirements under section 112(r) of the federal Clean Air Act.
 - (4) Any affected source.
 - (5) Any source in a source category designated by the administrator of the United States environmental protection agency.
- b. The following source categories are exempt from the requirements of this section:
 - (1) All sources listed in subdivision a that are not major sources, affected sources, or solid waste incineration units required to obtain a permit pursuant to section 129(e) of the federal Clean Air Act, are exempt from the obligation to obtain a title V permit until such time as the administrator of the United States environmental protection agency completes a rulemaking to determine how the program should be structured for nonmajor sources and the appropriateness of any permanent exemptions.
 - (2) In the case of nonmajor sources subject to a standard or other requirement under either section 111 or 112 of the federal Clean Air Act after July 21, 1992, those the administrator of the United States environmental protection agency determines to

be exempt from the requirement to obtain a title V source permit at the time that the new standard is promulgated.

- (3) Any source listed as exempt from the requirement to obtain a permit under this section may opt to apply for a title V permit. Sources that are exempted by paragraphs 1 and 2 and which do not opt to apply for a title V permit to operate are subject to the requirements of section 33.1-15-14-03.
- (4) The following source categories are exempted from the obligation to obtain a permit under this section.
 - (a) All sources and source categories that would be required to obtain a permit solely because they are subject to 40 CFR 60, subpart AAA - standards of performance for new residential wood heaters.
 - (b) All sources and source categories that would be required to obtain a permit solely because they are subject to 40 CFR 61, subpart M - national emission standard for hazardous air pollutants for asbestos, section 61.145, standard for demolition and renovation.
- c. For major sources, the department will include in the permit all applicable requirements for all relevant emissions units in the major source.

For any nonmajor source subject to the requirements of this section, the department will include in the permit all applicable requirements applicable to the emissions units that cause the source to be subject to this section.

- d. Fugitive emissions from a source subject to the requirements of this section shall be included in the permit application and the permit in the same manner as stack emissions, regardless of whether the source category in question is included in the list of sources contained in the definition of major source.
3. **Scope.** Nothing within this section shall relieve the owner or operator of a source of the requirement to obtain a permit to construct under section 33.1-15-14-02 or to comply with any other applicable standard or requirement of this article.
4. **Permit applications.**
- a. Duty to apply. For each title V source, the owner or operator shall submit a timely and complete permit application in accordance with this subdivision.

(1) Timely application.

- (a) A timely application for a source applying for a title V permit for the first time is one that is submitted within one year of the source becoming subject to this section.
- (b) Title V sources required to meet the requirements under section 112(g) of the federal Clean Air Act, or to have a permit to construct under section 33.1-15-14-02, shall file a complete application to obtain the title V permit or permit revision within twelve months after commencing operation. Where an existing title V permit would prohibit such construction or change in operation, the source must obtain a permit revision before commencing operation.
- (c) For purposes of permit renewal, a timely application is one that is submitted at least six months, but not more than eighteen months, prior to the date of permit expiration.

- (2) Complete application. To be deemed complete, an application must provide all information required pursuant to subdivision c, except that applications for a permit revision need supply such information only if it is related to the proposed change. Information required under subdivision c must be sufficient to evaluate the subject source and its application and to determine all applicable requirements. A responsible official must certify the submitted information consistent with subdivision d. Unless the department determines that an application is not complete within sixty days of receipt of the application, such application shall be deemed to be complete, except as otherwise provided in paragraph 3 of subdivision a of subsection 6. If, while processing an application that has been determined or deemed to be complete, the department determines that additional information is necessary to evaluate or take final action on that application, it may request such information in writing and set a reasonable deadline for a response. The source's ability to operate without a permit, as set forth in subdivision b of subsection 6, shall be in effect from the date the application is determined or deemed to be complete until the final permit is issued, provided that the applicant submits any requested additional information by the deadline specified by the department.
- (3) Confidential information. If a source has submitted information to the department under a claim of confidentiality, the source must also submit a copy of such information directly to the administrator of the United States environmental protection agency when directed to do so by the department.
- b. Duty to supplement or correct application. Any applicant who fails to submit any relevant facts or who has submitted incorrect information in a permit application shall, upon becoming aware of such failure or incorrect submittal, promptly submit such supplementary facts or corrected information. In addition, an applicant shall provide additional information as necessary to address any requirements that become applicable to the source after the date it filed a complete application but prior to release of a draft permit.
- c. Standard application form and required information. All applications for a title V permit to operate shall be made on forms supplied by the department. Information as described below for each emissions unit at a title V source shall be included in the application. Detailed information for emissions units or activities that have the potential to emit less than the following quantities of air contaminants (insignificant units or activities) need not be included in permit applications:
- Particulate: 2 tons [1.81 metric tons] per year.
- Inhalable particulate: 2 tons [1.81 metric tons] per year.
- Sulfur dioxide: 2 tons [1.81 metric tons] per year.
- Hydrogen sulfide: 2 tons [1.81 metric tons] per year.
- Carbon monoxide: 2 tons [1.81 metric tons] per year.
- Nitrogen oxides: 2 tons [1.81 metric tons] per year.
- Ozone: 2 tons [1.81 metric tons] per year.
- Reduced sulfur compounds: 2 tons [1.81 metric tons] per year.
- Volatile organic compounds: 2 tons [1.81 metric tons].

All other regulated contaminants including those in section 112(b) of the federal Clean Air Act: 0.5 tons [0.45 metric tons] per year.

Where a contaminant could be placed in more than one category, the smallest emission level applies.

However, for insignificant activities or emissions units, a list of such activities or units must be included in the application. An applicant may not omit information needed to determine the applicability of, or to impose, any applicable requirement, or to evaluate the fee amount required under section 33.1-15-23-04. The application, shall, as a minimum, include the elements specified below:

- (1) Identifying information, including company name and address (or plant name and address if different from the company name), owner's name and agent, and telephone number and names of plant site manager or contact.
- (2) A description of the source's processes and products (by Standard Industrial Classification Code) including those associated with any proposed alternative operating scenario identified by the source.
- (3) The following emissions-related information:
 - (a) All emissions of contaminants for which the source is major, and all emissions of regulated air contaminants. A permit application shall describe all emissions of regulated air contaminants emitted from any emissions unit, except when such units are exempted under this subdivision.
 - (b) Identification and description of all points of emissions described in subparagraph a in sufficient detail to establish the basis for fees and applicability of requirements of the federal Clean Air Act and this article.
 - (c) Emissions rates in tons per year and in such terms as are necessary to establish compliance consistent with the applicable standard reference test method. For emissions units subject to an annual emissions cap, tons per year can be reported as part of the aggregate emissions associated with the cap, except where more specific information is needed, including where necessary to determine or assure compliance with, or both, an applicable requirement.
 - (d) Fuels, fuel use, raw materials, production rates, and operating schedules.
 - (e) Identification and description of air pollution control equipment and compliance monitoring devices or activities.
 - (f) Limitations on source operation affecting emissions or any work practice standards, when applicable, for all regulated contaminants.
 - (g) Other information required by any applicable requirement including information related to stack height limitations developed pursuant to chapter 33.1-15-18.
 - (h) Calculations on which the information in subparagraphs a through g is based.
- (4) The following air pollution control requirements:
 - (a) Citation and description of all applicable requirements; and
 - (b) Description of or reference to any applicable test method for determining compliance with each applicable requirement.

- (5) Other specific information that may be necessary to implement and enforce other applicable requirements of the federal Clean Air Act or of this article or to determine the applicability of such requirements.
- (6) An explanation of any proposed exemptions from otherwise applicable requirements.
- (7) Additional information as determined to be necessary by the department to define proposed alternative operating scenarios identified by the source pursuant to paragraph 9 of subdivision a of subsection 5 or to define permit terms and conditions implementing any alternative operating scenario under paragraph 9 of subdivision a of subsection 5 or implementing paragraph 2 of subdivision b of subsection 6, paragraph 3 of subdivision b of subsection 6, paragraph 8 of subdivision a of subsection 5, or paragraph 10 of subdivision a of subsection 5. The permit application shall include documentation demonstrating that the source has obtained all authorizations required under the applicable requirements relevant to any proposed alternative operating scenarios, or a certification that the source has submitted all relevant materials to the department for obtaining such authorizations.
- (8) A compliance plan for all title V sources that contains all the following:
 - (a) A description of the compliance status of the source with respect to all applicable requirements.
 - (b) A description as follows:
 - [1] For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.
 - [2] For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis.
 - [3] For requirements for which the source is not in compliance at the time of permit issuance, a narrative description of how the source will achieve compliance with such requirements.
 - [4] For applicable requirements associated with a proposed alternative operating scenario, a statement that the source will meet such requirements upon implementation of the alternative operating scenario. If a proposed alternative operating scenario would implicate an applicable requirement that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis.
 - (c) A compliance schedule as follows:
 - [1] For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.
 - [2] For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis. A statement that the source will meet in a timely manner applicable requirements that become effective during the permit term shall satisfy this provision, unless a more detailed schedule is expressly required by the applicable requirement.

- [3] A schedule of compliance for sources that are not in compliance with all applicable requirements at the time of permit issuance. Such a schedule shall include a schedule of remedial measures, including an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. Any such schedule of compliance shall be supplemental to, and shall not sanction noncompliance with, the applicable requirements on which it is based.
- [4] For applicable requirements associated with a proposed alternative operating scenario, a statement that the source will meet such requirements upon implementation of the alternative operating scenario. If a proposed alternative operating scenario would implicate an applicable requirement that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis. A statement that the source will meet in a timely manner applicable requirements that become effective during the permit term will satisfy this provision, unless a more detailed schedule is expressly required by the applicable requirement.
- (d) A schedule for submission of certified progress reports no less frequently than every six months for sources required to have a schedule of compliance to remedy a violation.
- (e) The compliance plan content requirements specified in this paragraph shall apply and be included in the acid rain portion of a compliance plan for an affected source, except as specifically superseded by regulations promulgated under title IV of the federal Clean Air Act with regard to the schedule and method or methods the source will use to achieve compliance with the acid rain emissions limitations.
- (9) Requirements for compliance certification, including the following:
 - (a) A certification of compliance with all applicable requirements by a responsible official consistent with subdivision d and section 114(a)(3) of the federal Clean Air Act;
 - (b) A statement of methods used for determining compliance, including a description of monitoring, recordkeeping, and reporting requirements and test methods;
 - (c) A schedule for submission of compliance certifications during the permit term, to be submitted annually, or more frequently if specified by the underlying applicable requirement; and
 - (d) A statement indicating the source's compliance status with any applicable enhanced monitoring and compliance certification requirements of the federal Clean Air Act.
- (10) The use of nationally standardized forms for acid rain portions of permit applications and compliance plans, as required by regulations promulgated under title IV of the federal Clean Air Act.

- d. Any application form, report, or compliance certification submitted pursuant to these rules shall contain certification by a responsible official of truth, accuracy, and completeness. This certification and any other certification required under this section shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

5. Permit content.

- a. Standard permit requirements. Each permit issued under this section shall include, as a minimum, the following elements:
 - (1) Emissions limitations and standards, including those operational requirements and limitations that assure compliance with all applicable requirements at the time of permit issuance. Such requirements and limitations may include approved replicable methodologies identified by the source in its title V permit application as approved by the department, provided that no approved replicable methodology shall contravene any terms needed to comply with any otherwise applicable requirement or requirement of this section or circumvent any applicable requirement that would apply as a result of implementing the approved replicable methodology.
 - (a) The permit must specify and reference the origin of and authority for each term or condition, and identify any difference in form as compared to the applicable requirement upon which the term or condition is based.
 - (b) The permit must state that, if an applicable requirement of the federal Clean Air Act is more stringent than an applicable requirement of regulations promulgated under title IV of the federal Clean Air Act, both provisions shall be incorporated into the permit and shall be enforceable by the administrator of the United States environmental protection agency and the department.
 - (c) If the state implementation plan allows a determination of an alternative emissions limit at a title V source, equivalent to that contained in the plan, to be made in the permit issuance, renewal, or significant modification process, and the department elects to use such process, any permit containing such equivalency determination shall contain provisions to ensure that any resulting emissions limit has been demonstrated to be quantifiable, accountable, enforceable, and based on replicable procedures.
 - (2) Permit duration. For all sources, the term of the permit may not exceed five years. The permit expires on the date listed on the permit.
 - (3) Monitoring and related recordkeeping and reporting requirements.
 - (a) Each permit shall contain the following requirements with respect to monitoring:
 - [1] All monitoring and analysis procedures or test methods required under applicable monitoring and testing requirements, including subsection 10 and any procedures and methods promulgated pursuant to sections 504(b) or 114(a)(3) of the federal Clean Air Act. If more than one monitoring or testing requirement applies, the permit may specify a streamlined set of monitoring or testing provisions provided the specified monitoring or testing is adequate to assure compliance at least to the same extent as the monitoring or testing applicable requirements that are not included in the permit as a result of such streamlining;

- [2] If the applicable requirement does not require periodic testing or instrumental or noninstrumental monitoring (which may consist of recordkeeping designed to serve as monitoring), periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit, as reported pursuant to subparagraph c. Such monitoring requirements shall assure use of terms, test methods, units, averaging periods, and other statistical conventions consistent with the applicable requirement. Recordkeeping provisions may be sufficient to meet the requirements of this item; and
 - [3] As necessary, requirements concerning the use, maintenance, and, if appropriate, installation of monitoring equipment or methods.
- (b) With respect to recordkeeping, the permit shall incorporate all applicable recordkeeping requirements and require, if applicable, the following:
- [1] Records of required monitoring information that include the following:
 - [a] The date, place as defined in the permit, and time of sampling or measurements;
 - [b] The dates analyses were performed;
 - [c] The company or entity that performed the analyses;
 - [d] The analytical techniques or methods used;
 - [e] The results of such analyses; and
 - [f] The operating conditions as existing at the time of sampling or measurement;
 - [2] Retention of records of all required monitoring data and support information for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records and all original strip-chart recordings for continuous monitoring instrumentation, and copies of all reports required by the permit.
- (c) With respect to reporting, the permit shall incorporate all applicable reporting requirements and require the following:
- [1] Submittal of reports of any required monitoring at least every six months. All instances of deviations from permit requirements must be clearly identified in such reports. All required reports must be certified by a responsible official consistent with subdivision d of subsection 4.
 - [2] Prompt reporting of deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. The department shall define "prompt" in the permit consistent with chapter 33.1-15-01 and the applicable requirements.
- (4) A permit condition prohibiting emissions exceeding any allowances that the source lawfully holds under title IV of the federal Clean Air Act or the regulations promulgated thereunder.

- (a) No permit revision shall be required for increases in emissions that are authorized by allowances acquired pursuant to title IV of the federal Clean Air Act, or the regulations promulgated thereunder, provided that such increases do not require a permit revision under any other applicable requirement.
 - (b) No limit shall be placed on the number of allowances held by the source. The source may not, however, use allowances as a defense to noncompliance with any other applicable requirement.
 - (c) Any such allowance shall be accounted for according to the procedures established in regulations promulgated under title IV of the federal Clean Air Act.
- (5) A severability clause to ensure the continued validity of the various permit requirements in the event of a challenge to any portions of the permit.
- (6) Provisions stating the following:
 - (a) The permittee must comply with all conditions of the title V permit. Any permit noncompliance constitutes a violation of the federal Clean Air Act and this article and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.
 - (b) It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.
 - (c) The permit may be modified, revoked, reopened, and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition.
 - (d) The permit does not convey any property rights of any sort, or any exclusive privilege.
 - (e) The permittee must furnish to the department, within a reasonable time, any information that the department may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. Upon request, the permittee must also furnish to the department copies of records required to be kept by the permit or, for information claimed to be confidential, the permittee must also furnish such records directly to the administrator of the United States environmental protection agency along with a claim of confidentiality.
- (7) A provision to ensure that the source pays fees to the department consistent with the fee schedule in chapter 33.1-15-23.
- (8) Emissions trading. No permit revision shall be required, under any approved economic incentives, marketable permits, emissions trading and other similar programs or processes for changes that are provided for in the permit and the state implementation plan.
- (9) Terms and conditions for reasonably anticipated alternative operating scenarios identified by the source in its application as approved by the department. Such terms and conditions:

- (a) Shall require the source, contemporaneously with making a change from one operating scenario to another, to record in a log at the permitted facility a record of the alternative operating scenario under which it is operating;
 - (b) Shall extend the permit shield described in subdivision f to all terms and conditions under each such alternative operating scenario; and
 - (c) Must ensure that the terms and conditions of each such alternative scenario meet all applicable requirements and the requirements of this section. The department shall not approve a proposed alternative operating scenario into the title V permit until the source has obtained all authorizations required under any applicable requirement relevant to that alternative operating scenario.
 - (10) Terms and conditions, if the permit applicant requests them, for the trading of emissions increases and decreases in the permitted facility, to the extent that the applicable requirements, including the state implementation plan, provide for trading such increases and decreases without a case-by-case approval of each emissions trade. Such terms and conditions:
 - (a) Shall include all terms required under subdivisions a and c to determine compliance;
 - (b) Shall extend the permit shield described in subdivision f to all terms and conditions that allow such increases and decreases in emissions; and
 - (c) Must meet all applicable requirements and requirements of this section.
 - (11) If a permit applicant requests it, the department shall issue permits that contain terms and conditions, including all terms required under subdivisions a and c to determine compliance, allowing for the trading of emissions increases and decreases in the permitted facility solely for the purpose of complying with a federally enforceable emissions cap that is established in the permit independent of otherwise applicable requirements provided the changes in emissions are not modifications under title I of the federal Clean Air Act and the changes do not exceed the emissions allowable under the permit. The permit applicant shall include in its application proposed replicable procedures and permit terms that ensure the emissions trades are quantifiable and enforceable. The department shall not be required to include in the emissions trading provisions any emissions units for which emissions are not quantifiable or for which there are no replicable procedures to enforce the emissions trades. The permit shall also require compliance with all applicable requirements. The permittee shall supply written notification at least seven days prior to the change to the department and the administrator of the United States environmental protection agency and shall state when the change will occur and shall describe the changes in emissions that will result and how these increases and decreases in emissions will comply with the terms and conditions of the permit. The permit shield described in subdivision f shall extend to terms and conditions that allow such increases and decreases in emissions.
- b. Federally enforceable requirements.
- (1) All terms and conditions in a title V permit, including any provisions designed to limit a source's potential to emit, are enforceable by the administrator of the United States environmental protection agency and citizens under the federal Clean Air Act.
 - (2) Notwithstanding paragraph 1, the department shall specifically designate as not being federally enforceable under the federal Clean Air Act any terms and conditions

included in the permit that are not required under the federal Clean Air Act or under any of its applicable requirements. Terms and conditions so designated are not subject to the requirements of subsections 6 and 7, or of this subsection, other than those contained in this subdivision.

- c. Compliance requirements. All title V permits shall contain the following elements with respect to compliance:
 - (1) Consistent with paragraph 3 of subdivision a, compliance certification, testing, monitoring, reporting, and recordkeeping requirements sufficient to assure compliance with the terms and conditions of the permit. Any document, including reports, required by a title V permit shall contain a certification by a responsible official that meets the requirements of subdivision d of subsection 4.
 - (2) Inspection and entry requirements that require that, upon presentation of credentials and other documents as may be required by law, the permittee shall allow the department or an authorized representative to perform the following:
 - (a) Enter upon the permittee's premises where a title V source is located or emissions-related activity is conducted, or where records must be kept under the conditions of the permit;
 - (b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit;
 - (c) Inspect at reasonable times any facilities, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under the permit; and
 - (d) As authorized by the federal Clean Air Act and this article, sample or monitor at reasonable times substances or parameters for the purpose of assuring compliance with the permit or applicable requirements.
 - (3) A schedule of compliance consistent with paragraph 8 of subdivision c of subsection 4.
 - (4) Progress reports consistent with an applicable schedule of compliance and paragraph 8 of subdivision c of subsection 4 to be submitted at least semiannually, or at a more frequent period if specified in the applicable requirement or by the department. Such progress reports shall contain the following:
 - (a) Dates for achieving the activities, milestones, or compliance required in the schedule of compliance, and dates when such activities, milestones, or compliance were achieved; and
 - (b) An explanation of why any dates in the schedule of compliance were not or will not be met, and any preventive or corrective measures adopted.
 - (5) Requirements for compliance certification with terms and conditions contained in the permit, including emissions limitations, standards, or work practices. Permits shall include each of the following:
 - (a) The frequency, which is annually or such more frequent periods as specified in the applicable requirement or by the department, of submissions of compliance certifications;

- (b) In accordance with paragraph 3 of subdivision a, a means for monitoring the compliance of the source with its emissions limitations, standards, and work practices. The means for monitoring shall be contained in applicable requirements or United States environmental protection agency guidance;
- (c) A requirement that the compliance certification include all of the following (provided that the identification of applicable information may cross-reference the permit or previous reports, as applicable):
 - [1] The identification of each term or condition of the permit that is the basis of the certification;
 - [2] The identification of the methods or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period. Such methods and other means shall include, at a minimum, the methods and means required under paragraph 3 of subdivision a. If necessary, the owner or operator also shall identify any other material information that must be included in the certification to comply with section 113(c)(2) of the federal Clean Air Act, which prohibits knowingly making a false certification or omitting material information;
 - [3] The status of compliance with the terms and conditions of the permit for the period covered by the certification, including whether compliance during the period was continuous or intermittent. The certification shall be based on the method or means designated in item 2. The certification shall identify each deviation and take it into account in the compliance certification. The certification shall also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion or exceedance as defined under subsection 10 occurred; and
 - [4] Such other facts as the department may require to determine the compliance status of the source;
- (d) A requirement that all compliance certifications be submitted to the administrator of the United States environmental protection agency as well as to the department; and
- (e) Such additional requirements as may be specified pursuant to sections 114(a)(3) and 504(b) of the federal Clean Air Act.
- (6) Such other provisions as the department may require.
- d. General permits.
 - (1) The department may, after notice and opportunity for public participation provided under subdivision h of subsection 6, issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to other title V permits and shall identify criteria by which sources may qualify for the general permit. To sources that qualify, the department shall grant the conditions and terms of the general permit. Notwithstanding the shield provisions of subdivision f, the source shall be subject to enforcement action for operation without a title V permit to operate if the source is later determined not to qualify for the conditions and terms of the general permit. General permits shall not be authorized for affected sources under the acid rain program unless otherwise provided in

regulations promulgated under title IV of the federal Clean Air Act. The department is not required to issue a general permit in lieu of individual title V permits.

- (2) Title V sources that would qualify for a general permit must apply to the department for coverage under the terms of the general permit or must apply for a title V permit to operate consistent with subsection 4. The department may, in the general permit, provide for applications which deviate from the requirements of subsection 4, provided that such applications meet the requirements of title V of the federal Clean Air Act, and include all information necessary to determine qualification for, and to assure compliance with, the general permit. Without repeating the public participation procedures required under subdivision h of subsection 6, the department may grant a source's request for authorization to operate under a general permit, but such a grant shall not be a final permit action for purposes of judicial review.
- e. Temporary sources. The department may issue a single permit authorizing emissions from similar operations by the same source owner or operator at multiple temporary locations. The operation must be temporary and involve at least one change of location during the term of the permit. No affected source shall be permitted as a temporary source. Permits for temporary sources shall include the following:
 - (1) Conditions that will assure compliance with all applicable requirements at all authorized locations;
 - (2) Requirements that the owner or operator notify the department at least ten days in advance of each change in location; and
 - (3) Conditions that assure compliance with all other provisions of this section.
- f. Permit shield.
 - (1) Except as provided in this section, upon written request by the applicant, the department shall include in a title V permit to operate a provision stating that compliance with the conditions of the permit shall be deemed compliance with any applicable requirement as of the date of permit issuance, provided that:
 - (a) Such applicable requirements are included and are specifically identified in the permit; or
 - (b) The department, in acting on the permit application or revision, determines in writing that other requirements specifically identified are not applicable to the source, and the permit includes the determination or a concise summary thereof.
 - (2) A title V permit that does not expressly state that a permit shield exists shall be presumed not to provide such a shield.
 - (3) Nothing in this subdivision or in any title V permit shall alter or affect the following:
 - (a) The provisions of section 303 of the federal Clean Air Act (emergency orders), including the authority of the administrator of the United States environmental protection agency under that section;
 - (b) The liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance;

- (c) The applicable requirements of the acid rain program, consistent with section 408(a) of the federal Clean Air Act; or
- (d) The ability of the United States environmental protection agency to obtain information from a source pursuant to section 114 of the federal Clean Air Act.

g. Emergency provision.

- (1) An "emergency" means any situation arising from sudden and reasonably unforeseeable events beyond the control of the source, including acts of God, which situation requires immediate corrective action to restore normal operation, and that causes the source to exceed a technology-based emissions limitation under the title V permit to operate, due to unavoidable increases in emissions attributable to the emergency. An emergency shall not include noncompliance to the extent caused by improperly designed equipment, lack of preventive maintenance, careless or improper operation, or operator error.
- (2) Effect of an emergency. An emergency constitutes an affirmative defense to an action brought for noncompliance with such technology-based emissions limitations if the conditions of paragraph 3 are met.
- (3) The affirmative defense of emergency shall be demonstrated through properly signed, contemporaneous operating logs, or other relevant evidence that:
 - (a) An emergency occurred and that the permittee can identify the causes of the emergency;
 - (b) The permitted facility was at the time being properly operated;
 - (c) During the period of the emergency the permittee took all reasonable steps to minimize levels of emissions that exceeded the emissions standards, or other requirements in the permit; and
 - (d) The permittee submitted notice of the emergency to the department within one working day of the time when emissions limitations were exceeded due to the emergency. This notice fulfills the requirement of item 2 of subparagraph c of paragraph 3 of subdivision a. This notice must contain a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken.
- (4) In any enforcement proceeding, the permittee seeking to establish the occurrence of an emergency has the burden of proof.
- (5) This provision is in addition to any emergency or upset provision contained in any applicable requirement and the malfunction notification required under subdivision b of subsection 2 of section 33.1-15-01-13 when a threat to health and welfare would exist.

6. **Permit issuance, renewal, reopenings, and revisions.**

a. Action on application.

- (1) A permit, permit modification, or permit renewal may be issued only if all of the following conditions have been met:
 - (a) The department has received a complete application for a permit, permit modification, or permit renewal, except that a complete application need not be

received before issuance of a general permit under subdivision d of subsection 5;

- (b) Except for modifications qualifying for minor permit modification procedures under paragraphs 1 and 2 of subdivision e, the department has complied with the requirements for public participation under subdivision h;
 - (c) The department has complied with the requirements for notifying and responding to affected states under subdivision b of subsection 7;
 - (d) The conditions of the permit provide for compliance with all applicable requirements and the requirements of this section; and
 - (e) The administrator of the United States environmental protection agency has received a copy of the proposed permit and any notices required under subdivisions a and b of subsection 7, and has not objected to issuance of the permit under subdivision c of subsection 7 within the time period specified therein.
- (2) Except for applications received during the initial transitional period described in 40 CFR 70.4(b)(11) or under regulations promulgated under title IV or title V of the federal Clean Air Act for the permitting of affected sources under the acid rain program, the department shall take final action on each permit application, including a request for permit modification or renewal, within eighteen months after receiving a complete application.
 - (3) The department shall provide notice to the applicant of whether the application is complete. Unless the department requests additional information or otherwise notifies the applicant of incompleteness within sixty days of receipt of an application, the application shall be deemed complete. For modifications processed through the minor permit modification procedures, in paragraphs 1 and 2 of subdivision e, a completeness determination is not required.
 - (4) The department shall provide a statement that sets forth the legal and factual basis for the draft permit conditions, including references to the applicable statutory or regulatory provisions. The department shall send this statement to the United States environmental protection agency and to any other person who requests it.
 - (5) The submittal of a complete application shall not affect the requirement that any source have a permit to construct under section 33.1-15-14-02.

b. Requirement for a permit.

- (1) Except as provided in the following sentence, paragraphs 2 and 3, subparagraph e of paragraph 1 of subdivision e, and subparagraph e of paragraph 2 of subdivision e, no title V source may operate after the time that it is required to submit a timely and complete application under this section, except in compliance with a permit issued under this section. If a title V source submits a timely and complete application for permit issuance, including for renewal, the source's failure to have a title V permit is not a violation of this section until the department takes final action on the permit application, except as noted in this subsection. This protection shall cease to apply if, subsequent to the completeness determination made pursuant to paragraph 3 of subdivision a, and as required by paragraph 2 of subdivision a of subsection 4, the applicant fails to submit by the deadline specified in writing by the department any additional information identified as being needed to process the application. For timely and complete renewal applications for which the

department has failed to issue or deny the renewal permit before the expiration date of the previous permit, all the terms and conditions of the permit, including the permit shield that was granted pursuant to subdivision f of subsection 5 shall remain in effect until the renewal permit has been issued or denied.

- (2) A permit revision is not required for section 502(b)(10) changes provided:
- (a) The changes are not modifications under chapters 33.1-15-12, 33.1-15-13, and 33.1-15-15 or title I of the federal Clean Air Act.
 - (b) The changes do not exceed the emissions allowable under the title V permit whether expressed therein as a rate of emissions or in terms of total emissions.
 - (c) A permit to construct under section 33.1-15-14-02 has been issued, if required.
 - (d) The facility provides the department and the administrator of the United States environmental protection agency with written notification at least seven days in advance of the proposed change. The written notification shall include a description of each change within the permitted facility, the date on which the change will occur, any change in emissions, and any permit term or condition that is no longer applicable as a result of the change.

The permit shield described in subdivision f of subsection 5 shall not apply to any change made pursuant to this paragraph.

- (3) A permit revision is not required for changes that are not addressed or prohibited by the permit provided:
- (a) Each such change shall meet all applicable requirements and shall not violate any existing permit term or condition.
 - (b) The source must provide contemporaneous written notice to the department and the administrator of the United States environmental protection agency of each such change, except for changes that qualify as insignificant under the provisions of subdivision c of subsection 4. Such written notice shall describe each such change, including the date, any change in emissions, contaminants emitted, and any applicable requirement that would apply as a result of the change.
 - (c) The permittee shall keep a record describing changes made at the source that result in emissions of a regulated air contaminant subject to an applicable requirement, but not otherwise regulated under the permit, and the emissions resulting from those changes.
 - (d) The changes are not subject to any requirements under title IV of the federal Clean Air Act.
 - (e) The changes are not modifications under chapters 33.1-15-12, 33.1-15-13, and 33.1-15-15 or any provision of title I of the federal Clean Air Act.
 - (f) A permit to construct under section 33.1-15-14-02 has been issued, if required.

The permit shield described in subdivision f of subsection 5 shall not apply to any change made pursuant to this paragraph.

c. Permit renewal and expiration.

- (1) Permits being renewed are subject to the same procedural requirements, including those for public participation, affected state and the United States environmental protection agency review, that apply to initial permit issuance; and
 - (2) Permit expiration terminates the source's right to operate unless a timely and complete renewal application has been submitted consistent with subdivision b of subsection 6 and subparagraph c of paragraph 1 of subdivision a of subsection 4.
- d. Administrative permit amendments.
- (1) An "administrative permit amendment" is a permit revision that:
 - (a) Corrects typographical errors;
 - (b) Identifies a change in the name, address, or telephone number of any person identified in the permit, or provides a similar minor administrative change at the source;
 - (c) Requires more frequent monitoring or reporting by the permittee;
 - (d) Allows for a change in ownership or operational control of a source if the department determines that no other change in the permit is necessary, provided that a written agreement containing a specific date for transfer of permit responsibility, coverage, and liability between the current and new permittee has been submitted to the department;
 - (e) Incorporates into the title V permit the requirements from a permit to construct, provided that the permit to construct review procedure is substantially equivalent to the requirements of subsections 6 and 7 that would be applicable to the change if it were subject to review as a permit modification, and compliance requirements substantially equivalent to those contained in subsection 5; or
 - (f) Incorporates any other type of change which the administrator of the United States environmental protection agency has approved as being an administrative permit amendment as part of the approved title V operating permit program.
 - (2) Administrative permit amendments for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under title IV of the federal Clean Air Act.
 - (3) Administrative permit amendment procedures. An administrative permit amendment may be made by the department consistent with the following:
 - (a) The department shall take no more than sixty days from receipt of a request for an administrative permit amendment to take final action on such request, and may incorporate such changes without providing notice to the public or affected states provided that it designates any such permit revisions as having been made pursuant to this subdivision.
 - (b) The department shall submit a copy of the revised permit to the administrator of the United States environmental protection agency.
 - (c) The source may implement the changes addressed in the request for an administrative amendment immediately upon submittal of the request provided a permit to construct under section 33.1-15-14-02 has been issued, if required.

- (4) The department may, upon taking final action granting a request for an administrative permit amendment, allow coverage by the permit shield in subdivision f of subsection 5 for administrative permit amendments made pursuant to subparagraph e of paragraph 1 of subdivision d which meet the relevant requirements of subsections 5, 6, and 7 for significant permit modifications.
- e. Permit modification. A permit modification is any revision to a title V permit that cannot be accomplished under the provisions for administrative permit amendments under subdivision d. A permit modification for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under title IV of the federal Clean Air Act.
- (1) Minor permit modification procedures.
- (a) Criteria.
- [1] Minor permit modification procedures may be used only for those permit modifications that:
- [a] Do not violate any applicable requirement;
 - [b] Do not involve significant changes to existing monitoring, reporting, or recordkeeping requirements in the permit;
 - [c] Do not require or change a case-by-case determination of an emissions limitation or other standard, or a source-specific determination for temporary sources of ambient impacts, or a visibility or increment analysis;
 - [d] Do not seek to establish or change a permit term or condition for which there is no corresponding underlying applicable requirement and that the source has assumed to avoid an applicable requirement to which the source would otherwise be subject. Such terms and conditions include a federally enforceable emissions cap assumed to avoid classification as a modification under any provision of title I of the federal Clean Air Act; and an alternative emissions limit approved pursuant to regulations promulgated under section 112(i)(5) of the federal Clean Air Act;
 - [e] Are not modifications under chapters 33.1-15-12, 33.1-15-13, and 33.1-15-15 or any provision of title I of the federal Clean Air Act; and
 - [f] Are not required to be processed as a significant modification.
- [2] Notwithstanding item 1 and subparagraph a of paragraph 2 of subdivision e, minor permit modification procedures may be used for permit modifications involving the use of economic incentives, marketable permits, emissions trading, and other similar approaches, to the extent that such minor permit modification procedures are explicitly provided for in the state implementation plan, or in applicable requirements promulgated by the United States environmental protection agency.
- (b) Application. An application requesting the use of minor permit modification procedures shall meet the requirements of subdivision c of subsection 4 and shall include the following:
- [1] A description of the change, the emissions resulting from the change, and any new applicable requirements that will apply if the change occurs;

- [2] The source's suggested draft permit;
 - [3] Certification by a responsible official, consistent with subdivision d of subsection 4, that the proposed modification meets the criteria for use of minor permit modification procedures and a request that such procedures be used; and
 - [4] Completed forms for the department to use to notify the administrator of the United States environmental protection agency and affected states as required under subsection 7.
- (c) United States environmental protection agency and affected state notification. Within five working days of receipt of a complete permit modification application, the department shall notify the administrator of the United States environmental protection agency and affected states of the requested permit modification. The department shall promptly send any notice required under paragraph 2 of subdivision b of subsection 7 to the administrator of the United States environmental protection agency.
- (d) Timetable for issuance. The department may not issue a final permit modification until after the United States environmental protection agency forty-five-day review period or until the United States environmental protection agency has notified the department that the United States environmental protection agency will not object to issuance of the permit modification, whichever is first, although the department can approve the permit modification prior to that time. Within ninety days of the department's receipt of an application under minor permit modification procedures or fifteen days after the end of the administrator's forty-five-day review period under subdivision c of subsection 7, whichever is later, the department shall:
- [1] Issue the permit modification as proposed;
 - [2] Deny the permit modification application;
 - [3] Determine that the requested modification does not meet the minor permit modification criteria and should be reviewed under the significant modification procedures; or
 - [4] Revise the draft permit modification and transmit to the administrator the new proposed permit modification as required by subdivision a of subsection 7.
- (e) Source's ability to make change. A source may make the change proposed in its minor permit modification application only after it files such application and the department approves the change in writing. If the department allows the source to make the proposed change prior to taking action specified in items 1, 2, and 3 of subparagraph d, the source must comply with both the applicable requirements governing the change and the proposed permit terms and conditions. During this time period, the source need not comply with the existing permit terms and conditions it seeks to modify. However, if the source fails to comply with its proposed permit terms and conditions during this time period, the existing permit terms and conditions it seeks to modify may be enforced against it.
- (f) The permit shield under subdivision f of subsection 5 shall not extend to minor permit modifications.

- (2) Group processing of minor permit modifications. Consistent with this paragraph, the department may modify the procedure outlined in paragraph 1 to process groups of a source's applications for certain modifications eligible for minor permit modification processing.
- (a) Criteria. Group processing of modifications may be used only for those permit modifications:
- [1] That meet the criteria for minor permit modification procedures under item 1 of subparagraph a of paragraph 1 of subdivision e; and
 - [2] That collectively are below the threshold level which is ten percent of the emissions allowed by the permit for the emissions unit for which the change is requested, twenty percent of the applicable definition of major source in subsection 1, or five tons [4.54 metric tons] per year, whichever is least.
- (b) Application. An application requesting the use of group processing procedures shall meet the requirements of subdivision c of subsection 4 and shall include the following:
- [1] A description of the change, the emissions resulting from the change, and any new applicable requirements that will apply if the change occurs.
 - [2] The source's suggested draft permit.
 - [3] Certification by a responsible official, consistent with subdivision d of subsection 4, that the proposed modification meets the criteria for use of group processing procedures and a request that such procedures be used.
 - [4] A list of the source's other pending applications awaiting group processing, and a determination of whether the requested modification, aggregated with these other applications, equals or exceeds the threshold set under item 2 of subparagraph a of paragraph 2 of subdivision e.
 - [5] Certification, consistent with subdivision d of subsection 4, that the source has notified the United States environmental protection agency of the proposed modification. Such notification need only contain a brief description of the requested modification.
 - [6] Completed forms for the department to use to notify the administrator of the United States environmental protection agency and affected states as required under subsection 7.
- (c) United States environmental protection agency and affected state notification. On a quarterly basis or within five business days of receipt of an application demonstrating that the aggregate of a source's pending applications equals or exceeds the threshold level set under item 2 of subparagraph a of paragraph 2 of subdivision e, whichever is earlier, the department shall meet its obligation under paragraph 1 of subdivision a of subsection 7 and paragraph 1 of subdivision b of subsection 7 to notify the administrator of the United States environmental protection agency and affected states of the requested permit modifications. The department shall send any notice required under paragraph 2 of subdivision b of subsection 7 to the administrator of the United States environmental protection agency.

- (d) Timetable for issuance. The provisions of subparagraph d of paragraph 1 of subdivision e shall apply to modifications eligible for group processing, except that the department shall take one of the actions specified in items 1 through 4 of subparagraph d of paragraph 1 of subdivision e within one hundred eighty days of receipt of the application or fifteen days after the end of the administrator's forty-five-day review period under subdivision c of subsection 7, whichever is later.
 - (e) Source's ability to make change. The provisions of subparagraph e of paragraph 1 apply to modifications eligible for group processing.
 - (f) The permit shield under subdivision f of subsection 5 shall not extend to group processing of minor permit modifications.
- (3) Significant modification procedures.
- (a) Criteria. Significant modification procedures shall be used for applications requesting permit modifications that do not qualify as minor permit modifications or as administrative amendments. Every significant change in existing monitoring permit terms or conditions and every relaxation of reporting or recordkeeping permit terms or conditions shall be considered significant. Nothing herein shall be construed to preclude the permittee from making changes consistent with this subsection that would render existing permit compliance terms and conditions irrelevant.
 - (b) Significant permit modifications shall meet all requirements of this section, including those for applications, public participation, review by affected states, and review by the United States environmental protection agency, as they apply to permit issuance and permit renewal. The department shall complete review of significant permit modifications within nine months after receipt of a complete application.
- f. Reopening for cause.
- (1) Each issued permit shall include provisions specifying the conditions under which the permit will be reopened prior to the expiration of the permit. A permit shall be reopened and revised under any of the following circumstances:
 - (a) Additional applicable requirements under the federal Clean Air Act become applicable to a major title V source with a remaining permit term of three or more years. Such a reopening shall be completed not later than eighteen months after promulgation of the applicable requirement. No such reopening is required if the effective date of the requirement is later than the date on which the permit is due to expire, unless the original permit or any of its terms and conditions has been extended.
 - (b) Additional requirements, including excess emissions requirements, become applicable to an affected source under title IV of the federal Clean Air Act or the regulations promulgated thereunder. Upon approval by the administrator of the United States environmental protection agency, excess emissions offset plans shall be deemed to be incorporated into the permit.
 - (c) The department or the United States environmental protection agency determines that the permit contains a material mistake or that inaccurate statements were made in establishing the emissions standards or other terms or conditions of the permit.

- (d) The administrator of the United States environmental protection agency or the department determines that the permit must be revised or revoked to assure compliance with the applicable requirements.
 - (2) Proceedings to reopen and issue a permit shall follow the same procedures as apply to initial permit issuance and shall affect only those parts of the permit for which cause to reopen exists. Such reopening shall be made as expeditiously as practicable.
 - (3) Reopenings under paragraph 1 shall not be initiated before a notice of such intent is provided to the title V source by the department at least thirty days in advance of the date that the permit is to be reopened, except that the department may provide a shorter time period in the case of an emergency.
- g. Reopenings for cause by the United States environmental protection agency.
 - (1) If the administrator of the United States environmental protection agency finds that cause exists to terminate, modify, or revoke and reissue a permit pursuant to subdivision f, within ninety days after receipt of such notification, the department shall forward to the United States environmental protection agency a proposed determination of termination, modification, or revocation and reissuance, as appropriate.
 - (2) The administrator of the United States environmental protection agency will review the proposed determination from the department within ninety days of receipt.
 - (3) The department shall have ninety days from receipt of the United States environmental protection agency objection to resolve any objection that the United States environmental protection agency makes and to terminate, modify, or revoke and reissue the permit in accordance with the administrator's objection.
 - (4) If the department fails to submit a proposed determination or fails to resolve any objection, the administrator of the United States environmental protection agency will terminate, modify, or revoke and reissue the permit after taking the following actions:
 - (a) Providing at least thirty days' notice to the permittee in writing of the reasons for any such action.
 - (b) Providing the permittee an opportunity for comment on the administrator's proposed action and an opportunity for a hearing.
- h. Public participation. Except for modifications qualifying for minor permit modification procedures, all permit proceedings, including initial permit issuance, significant modifications, and renewals, shall be subject to procedures for public notice including offering an opportunity for public comment and a hearing on the draft permit. These procedures shall include the following:
 - (1) Notice shall be given by publication in a newspaper of general circulation in the area where the source is located or in a state publication designed to give general public notice; to persons on a mailing list developed by the department, including those who request in writing to be on the list; on the department's website; and by other means if necessary to assure adequate notice to the affected public;
 - (2) The notice shall identify the affected facility; the name and address of the permittee; the name and address of the department; the activity or activities involved in the permit action; the emissions change involved in any permit modification; the name,

address, and telephone number of a person from whom interested persons may obtain additional information, including copies of the permit draft, the application, all relevant supporting materials, and all other materials available to the department that are relevant to the permit decision; a brief description of the comment procedures required by this subsection; and the time and place of any hearing that may be held, including a statement of procedures to request a hearing, unless a hearing has already been scheduled;

- (3) The department shall provide such notice and opportunity for participation by affected states as is provided for by subsection 7;
 - (4) The department shall provide at least thirty days for public comment and shall give notice of any public hearing at least thirty days in advance of the hearing; and
 - (5) The department shall keep a record of the commenters and also of the issues raised during the public participation process. These records shall be available to the public.
7. **Permit review by the United States environmental protection agency and affected states.**
- a. **Transmission of information to the administrator.**
 - (1) The department shall provide a copy of each permit application including any application for a permit modification (including the compliance plan), to the administrator of the United States environmental protection agency except that the applicant shall provide such information directly to the administrator of the United States environmental protection agency when directed to do so by the department. The department shall provide a copy of each proposed permit and each final title V permit to operate to the administrator of the United States environmental protection agency. To the extent practicable, the preceding information shall be provided in computer-readable format compatible with the United States environmental protection agency's national database management system.
 - (2) The department may waive the requirements of paragraph 1 and paragraph 1 of subdivision b for any category of sources (including any class, type, or size within such category) other than major sources upon approval by the administrator of the United States environmental protection agency.
 - (3) The department shall keep these records for at least five years.
 - b. **Review by affected states.**
 - (1) The department shall give notice of each draft permit to any affected state on or before the time that the notice to the public under subdivision h of subsection 6 is given, except to the extent paragraphs 1 and 2 of subdivision e of subsection 6 require the timing of the notice to be different.
 - (2) As part of the submittal of the proposed permit to the administrator of the United States environmental protection agency (or as soon as possible after the submittal for minor permit modification procedures allowed under paragraphs 1 and 2 of subdivision e of subsection 6) the department shall notify the administrator of the United States environmental protection agency and any affected state in writing of any refusal by the department to accept all recommendations for the proposed permit that the affected state submitted during the public or affected state review period. The notice shall include the department's reasons for not accepting any such

recommendation. The department is not required to accept recommendations that are not based on applicable requirements or the requirements of this section.

- c. United States environmental protection agency objection. No permit for which an application must be transmitted to the administrator of the United States environmental protection agency under subdivision a shall be issued if the administrator of the United States environmental protection agency objects to its issuance in writing within forty-five days of receipt of the proposed permit and all necessary supporting information.
 - d. Public petitions to the administrator of the United States environmental protection agency. If the administrator of the United States environmental protection agency does not object in writing under subdivision c, any person may petition the administrator of the United States environmental protection agency within sixty days after the expiration of the administrator's forty-five-day review period to make such objection. Any such petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period provided for in subdivision h of subsection 6, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. If the administrator of the United States environmental protection agency objects to the permit as a result of a petition filed under this subdivision, the department shall not issue the permit until the United States environmental protection agency's objection has been resolved, except that a petition for review does not stay the effectiveness of a permit or its requirements if the permit was issued after the end of the forty-five-day review period and prior to the United States environmental protection agency's objection. If the department has issued a permit prior to receipt of the United States environmental protection agency's objection under this subdivision, the department may thereafter issue only a revised permit that satisfies the United States environmental protection agency's objection. In any case, the source will not be in violation of the requirement to have submitted a timely and complete application.
 - e. Prohibition on default issuance. The department shall issue no title V permit to operate, including a permit renewal or modification, until affected states and the United States environmental protection agency have had an opportunity to review the proposed permit as required under this subsection.
8. **Judicial review of title V permit to operate decisions.**
- a. The applicant, any person who participated in the department's public participation process, and any other person who could obtain judicial review under North Dakota Century Code section 28-32-42 may obtain judicial review provided such appeal is filed in accordance with North Dakota Century Code section 28-32-42 within thirty days after notice of the final permit action.
 - b. The department's failure to take final action on an application for a permit, permit renewal, or permit revision within the time frames referenced in this section shall be appealable in accordance with North Dakota Century Code section 28-32-42. A petition for judicial review may be filed any time before the department denies the permit or issues the final permit.
 - c. In accordance with North Dakota Century Code chapter 28-32, the mechanisms outlined in this subsection shall be the exclusive means for judicial review of permit decisions referenced in this section.
 - d. Solely for the purpose of obtaining judicial review in state court, final permit action shall include the failure of the department to take final action on an application for a permit, permit renewal, or permit revision within the time frames referenced in this section.

- e. Failure to take final action within ninety days of receipt of an application requesting minor permit modification procedures (or one hundred eighty days for modifications subject to group processing requirements) shall be considered final action and subject to judicial review in state court.
 - f. Petitions for judicial review of final permit actions may be filed after the deadline in North Dakota Century Code section 23.1-01-11, only if the petitions are based solely on grounds arising after the deadline for judicial review. Such petitions must be filed no later than thirty days after the new grounds for review arise.
9. **Enforcement.** The department may suspend, revoke, or terminate a permit for violations of this article, violation of any permit condition or for failure to respond to a notice of violation or any order issued pursuant to this article. A permit to operate which has been revoked or terminated pursuant to this article must be surrendered forthwith to the department. No person may operate or cause the operation of a source if the department denies, terminates, revokes, or suspends a permit to operate.
10. **Compliance assurance monitoring.** Except as noted below, title 40 Code of Federal Regulations part 64 compliance assurance monitoring, as it exists on July 2, 2010, is incorporated by reference.
- a. "Administrator" means the department except for those duties that cannot be delegated by the United States environmental protection agency. For those duties that cannot be delegated, administrator means the administrator of the United States environmental protection agency or the administrator's authorized representative.
 - b. "Part 70 permit" means a title V permit to operate.
 - c. "Permitting authority" means the department.

History: Effective January 1, 2019; amended effective July 1, 2020.

General Authority: NDCC 23.1-06-04, 23.1-06-08, 23.1-06-09, 23.1-06-10; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08, 23.1-06-09, 23.1-06-10; S.L. 2017, ch. 199, § 21

33.1-15-14-07. Source exclusions from title V permit to operate requirements.

- 1. **Purpose.** The purpose of this section is to clarify which sources are minor sources with respect to section 33.1-15-14-06. The owner or operator of any source that would be classified as a major source under section 33.1-15-14-06 and which is not specifically excluded by this section shall comply with the requirements of section 33.1-15-14-06.
- 2. **Definitions.** For purposes of this section:
 - a. "Bulk gasoline plant" means any bulk gasoline distribution facility that has a gasoline throughput less than or equal to twenty thousand gallons [75,700 liters] per day and that receives gasoline by truck rather than by rail.
 - b. "Coatings" means coatings plus diluents plus cleanup solvents.
 - c. "Fountain solution additives" includes isopropyl alcohol, n-propyl alcohol, n-butanol, and alcohol substitutes.
 - d. "Hazardous air contaminant" means any air contaminant listed pursuant to subsection 112(b) of the federal Clean Air Act.
 - e. "Refueling positions" means the number of vehicles that could be dispensing simultaneously at a gasoline service station.

3. **Applicability.**

- a. The owner or operator of the following stationary sources is not required to obtain a title V permit to operate under section 33.1-15-14-06 if the conditions of this section are met:
 - (1) Gasoline service stations.
 - (2) Gasoline bulk plants.
 - (3) Coating sources.
 - (4) Printing, publishing, and packaging operations.
 - (5) Degreasers using volatile organic solvents.
 - (6) Hot mix asphalt plants.
- b. Any facility obtaining coverage under this section must submit a notification in writing to the department within ninety days of publication of this section unless specifically exempted from this requirement in the applicable subdivision of this section. The notification must contain the following information:
 - (1) Facility name, location, and nature of business.
 - (2) A list of all the sources of air contaminants at the facility.
 - (3) The condition of this section which is applicable to the facility.
 - (4) Total material usage, source capacity, or throughput for the previous month or twelve months at the facility, in accordance with the subdivision that is applicable to the facility.
 - (5) A signed statement accepting the throughput or usage limitation.
- c. Complying with the conditions of this section does not exempt the owner or operator of a facility from the obligation to apply for and obtain a permit to construct or a minor source permit to operate unless specifically exempted in section 33.1-15-14-02 or 33.1-15-14-03.
- d. The owner or operator of any facility listed in subdivision a which has potential emissions that would classify it as a major source even after the conditions of this section are met, or are not able to comply with the applicable conditions, shall obtain a title V permit to operate or a minor source permit to operate which limits the potential to emit of the source to a level below the major source threshold.
- e. Complying with the conditions of this section does not relieve the owner or operator of a source of the responsibility to comply with any other applicable requirements of this article.
- f. If the facility deviates from any condition, limit, or requirement of this section, a report must be submitted to the department within thirty days of the deviation containing the following information:
 - (1) The facility's name and location.
 - (2) Applicable condition, limit, or requirement for the facility for which a deviation occurred.

- (3) A summary of the records showing the deviation, accompanied by an explanation of the deviation.
 - (4) A plan of action to prevent future occurrences of any deviation at the facility.
 - g. All records required by this section must be maintained for a period of five years from the last date of entry. The records must be available for inspection or submittal to the department upon request. If a facility is limited by a material usage, capacity, or throughput based on a twelve-month rolling period, a log must be updated monthly to include the previous twelve months' total material usage, capacity, or throughput.
4. **Exclusion standards.**
- a. Gasoline service stations. The owner or operator of sources where gasoline dispensing operations account for more than ninety percent of all emissions from the facility is not required to obtain a title V permit to operate if the following conditions are met:
 - (1) No vapor recovery is used:
 - (a) The source's total sales of gasoline must not exceed three hundred eighty thousand gallons [1,438,300 liters] per month in any calendar month. To demonstrate compliance with this limit, monthly records of throughput must be maintained at the source.
 - (b) If the number of refueling positions is no more than seventeen at the source, then the source is exempt from formal application to the department under subdivision b of subsection 3.
 - (2) Stage I vapor recovery is used:
 - (a) The source's total sales of gasoline must not exceed six hundred thirty thousand gallons [2,384,800 liters] per month in any calendar year. To demonstrate compliance with this limit, monthly records of throughput must be maintained at the source.
 - (b) If the number of refueling positions is no more than twenty-nine at the source, then the source is exempt from formal application to the department under subdivision b of subsection 3.
 - b. Gasoline bulk plants. The owner or operator of gasoline bulk plants where gasoline loading and unloading operations account for more than ninety percent of all emissions from the source are covered by this subdivision. To demonstrate compliance with the twenty thousand gallons [75,700 liters] per day of gasoline definition of a bulk plant, monthly records of throughput must be maintained at the source.
 - c. Coating sources.
 - (1) The owner or operator of sources where surface coating operations account for more than ninety percent of all hazardous air contaminant emissions from the facility is not required to obtain a title V permit to operate if the conditions in subparagraph a or b are met.
 - (a) The source's total usage of surface coatings must not exceed two hundred fifty gallons [946.25 liters] of coatings per month in any calendar month nor exceed three thousand gallons [11,355 liters] of coatings per twelve-month period. The coatings are limited to six pounds per gallon [719 grams per liter] of any individual hazardous air contaminant. To demonstrate compliance with the

usage limit, monthly records of material usage must be maintained at the facility.

- (b) The source's total hazardous air contaminant emissions shall not exceed ten tons per twelve-month period. Hazardous air contaminant emissions must be calculated by multiplying the surface coating material usage in gallons by the individual hazardous air contaminant content in pounds per gallon. To demonstrate compliance with the emissions limitation, the emissions must be calculated on a monthly basis and recorded in a log. All records of material usage, hazardous air contaminant content, and emissions must be maintained at the facility.
- (2) The owner or operator of an automobile refinishing shop where operations account for more than ninety percent of volatile organic compound emissions and hazardous air contaminant emissions is not required to obtain a title V permit to operate if the usage of coatings is less than two hundred fifty gallons [946.25 liters] per month or three thousand gallons [11,355 liters] of coatings per twelve-month period. This item does not apply to facilities capable of refinishing vehicles other than automobiles or trucks. Sources are exempt from the notification requirements under subdivision b of subsection 3 if:
 - (a) The auto refinishing shop business is entirely, or almost entirely, for collision repairs and the business has two or fewer bays;
 - (b) Substantial portions of the auto refinishing shop business are devoted to repainting entire vehicles and the business only has one bay devoted to painting; or
 - (c) The auto refinishing shop business does not have the physical or operational capability to do more than fifty jobs per week.
- d. Printing, publishing, and packaging operations.
 - (1) The owner or operator of facilities where sheetfed (nonheatset) offset lithography or nonheatset web offset lithography printing operations are conducted is not required to obtain a title V permit to operate if the conditions in subparagraphs a, b, and c are met.
 - (a) The facility must use less than fourteen thousand two hundred seventy-five gallons [54,030 liters] of cleaning solvent and fountain solution additives in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (b) The facility must use less than three thousand three hundred thirty-three gallons [12,615 liters] of materials containing multiple hazardous air contaminants in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (c) The facility must use less than one thousand three hundred thirty-three gallons [5,045 liters] of material containing any individual hazardous air contaminant in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (2) The owner or operator of facilities where heatset web offset lithography printing operations are conducted is not required to obtain a title V permit to operate if the conditions in subparagraphs a, b, and c are met.

- (a) The facility must use less than one hundred thousand pounds [45.36 megagrams] of ink, cleaning solvent, and fountain solution additives in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (b) The facility must use less than three thousand three hundred thirty-three gallons [12,615 liters] of materials containing multiple hazardous air contaminants in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (c) The facility must use less than one thousand three hundred thirty-three gallons [5,045 liters] of material containing any individual hazardous air contaminant in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
- (3) The owner or operator of facilities where screen printing operations are conducted is not required to obtain a title V permit to operate if the conditions in subparagraphs a, b, and c are met.
- (a) The facility must use less than fourteen thousand two hundred seventy-five gallons [54,030 liters] of the sum of solvent-based inks, cleaning solvents, adhesives, and coatings in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (b) The facility must use less than three thousand three hundred thirty-three gallons [12,615 liters] of materials containing multiple hazardous air contaminants in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (c) The facility must use less than one thousand three hundred thirty-three gallons [5,045 liters] of material containing any individual hazardous air contaminant in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
- (4) The owner or operator of facilities, where flexography, or rotogravure printing operations with water-based or ultraviolet-cured inks, coatings, and adhesives are conducted, is not required to obtain a title V permit to operate if the conditions in subparagraphs a, b, and c are met.
- (a) The facility must use less than four hundred thousand pounds [181 megagrams] of the sum of solvent-based inks, cleaning solvents, and adhesives in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (b) The facility must use less than three thousand three hundred thirty-three gallons [12,615 liters] of materials containing multiple hazardous air contaminants in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (c) The facility must use less than one thousand three hundred thirty-three gallons [5,045 liters] of material containing any individual hazardous air contaminant in

any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.

- (5) The owner or operator of facilities where flexography or rotogravure printing operations with solvent inks are conducted is not required to obtain a title V permit to operate if the conditions in subparagraphs a, b, and c are met.
 - (a) The facility must use less than one hundred thousand pounds [45,36 megagrams] of the sum of ink, coatings, adhesives, dilution solvents, and cleaning solvents in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (b) The facility must use less than three thousand three hundred thirty-three gallons [12,615 liters] of materials containing multiple hazardous air contaminants in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
 - (c) The facility must use less than one thousand three hundred thirty-three gallons [5,045 liters] of material containing any individual hazardous air contaminant in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of material usage must be maintained at the facility.
- e. Degreasers using volatile organic solvents. The owner or operator of facilities where degreasing operations account for more than ninety percent of all volatile organic compound emissions and hazardous air contaminant emissions from the facility is not required to obtain a title V permit to operate if the conditions in paragraph 1 or 2 are met.
 - (1) If non-halogenated solvents are used, the usage is limited to two thousand two hundred gallons [8,327 liters] of any one solvent-containing material and five thousand four hundred gallons [20,439 liters] of any combination of solvent-containing materials in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of solvent usage must be maintained at the facility.
 - (2) If halogenated solvents are used, including methyl chloroform, trichloroethane, and methylene chloride, the usage is limited to one thousand two hundred gallons [4,542 liters] of any one solvent-containing material and two thousand nine hundred gallons [10,976 liters] of any combination of solvent-containing materials in any twelve-month rolling period. To demonstrate compliance with the usage limit, monthly records of solvent usage must be maintained at the facility.
- f. Hot mix asphalt plants. The owner or operator of facilities where hot mix asphalt production operations account for more than ninety percent of all emissions from the facility is not required to obtain a title V permit to operate if the amount of hot mix asphalt produced does not exceed two hundred fifty thousand tons [226,757 metric tons] in any twelve-month rolling period. To demonstrate compliance with this limit, monthly records of hot mix asphalt produced must be maintained at the facility. Sources that are excluded under this subdivision must obtain a minor source permit to operate under section 33.1-15-14-03.

History: Effective January 1, 2019.

General Authority: NDCC 23.1-06-04; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08, 23.1-06-09; S.L. 2017, ch. 199, § 21

CHAPTER 33.1-15-25 REGIONAL HAZE REQUIREMENTS

Section

- 33.1-15-25-01 Definitions
- 33.1-15-25-02 Best Available Retrofit Technology
- 33.1-15-25-03 Technology Required to Make Reasonable Progress Toward the National Visibility Goal
- 33.1-15-25-04 Monitoring, Recordkeeping, and Reporting

33.1-15-25-01. Definitions.

The definitions in title 40 Code of Federal Regulations part 51, section 301, as they exist on July 1, 2019, are incorporated by reference into this chapter. For purposes of this chapter only:

1. "Boiler operating day" means any twenty-four-hour period between midnight and the following midnight during which any fuel is combusted at any time at the steam generating unit.
2. "Contributes to visibility impairment" means a change in visibility impairment in a class I federal area of five-tenths deciviews or more (twenty-four-hour average) above the average natural visibility baseline. A source exceeds the threshold when the ninety-eighth percentile (eighth highest value) of the modeling results based on any one year of the three years of meteorological data modeled exceeds five-tenths deciviews.

History: Effective January 1, 2019; amended effective July 1, 2020.

General Authority: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 21

33.1-15-25-02. Best available retrofit technology.

1. [Reserved].
2. **Installation of best available retrofit technology.** The owner or operator of any existing stationary facility as defined in title 40 Code of Federal Regulations section 301, which contributes to visibility impairment in a class I federal area shall install and operate best available retrofit technology. The equipment shall be installed and operating as expeditiously as practicable but in no event later than five years after the United States environmental protection agency's approval of North Dakota's state implementation plan revision for best available retrofit technology.
3. **Operation and maintenance of best available retrofit technology.** The owner or operator of a facility required to install best available retrofit technology under subsection 1 shall establish procedures to ensure such equipment is properly operated and maintained.

History: Effective January 1, 2019.

General Authority: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 21

33.1-15-25-03. Emission reduction measures required to make reasonable progress toward the national visibility goal.

The owner or operator of an existing stationary source, or group of sources, shall implement emission reduction measures to make reasonable progress, as determined in accordance with title 40, Code of Federal Regulations, part 51, section 308, when required in a state implementation plan revision developed by the department. The measures shall be implemented within a reasonable timeframe after the United States environmental protection agency's approval of North Dakota's state implementation plan revision. The measures and compliance deadline shall be determined on a source-

by-source basis and shall be included in North Dakota's state implementation plan revision. All required measures shall be properly operated and maintained.

History: Effective July 1, 2020.

General Authority: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 21

33.1-15-25-04. Monitoring, recordkeeping, and reporting.

The owner or operator of any existing stationary source, or group of sources that are required to install best available retrofit technology, or emission reduction measures to meet the reasonable progress goals, shall conduct monitoring, recordkeeping, and reporting sufficient to show compliance or noncompliance. Monitoring for sulfur dioxide and nitrogen oxides from the main stack of a fossil-fuel-fired steam electric plant shall be conducted using continuous emissions monitoring systems which comply with the requirements of section 33.1-15-21-09. Particulate monitoring shall be in accordance with the requirements of subsection 10 of section 33.1-15-14-06. Recordkeeping and reporting shall comply with the requirements of section 33.1-15-14-06. Monitoring, recordkeeping, and reporting for other source units shall comply with the requirements of section 33.1-15-14-06.

History: Effective January 1, 2019; amended effective July 1, 2020.

General Authority: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 1

Law Implemented: NDCC 23.1-06-04, 23.1-06-08; S.L. 2017, ch. 199, § 21
